Appendix G: Contact & Support....60

# Executive Summary

*ABOUT THIS DELIVERY: This document accompanies a standalone Dell tower delivered to the Marine Corps Warfighting Laboratory (MCWL) for pilot evaluation. The War Room is installed locally on the provided hardware, runs entirely on that hardware, and requires no external network connectivity. Nothing leaves the device under normal operation. The pilot supports a single user account operating from a White Cell perspective—sufficient to exercise the core workflows end-to-end—with a clear path to multi-user and networked deployments as the pilot scales. See Appendix A for hardware and Appendix E for the scaling path.*

*This document describes the full capability set of The War Room across all deployment configurations, so that evaluators can see the end-to-end vision of the platform. Capabilities that depend on multi-user collaboration, role-based access, shared workspaces, cross-event search, and networked or real-time data sources are not active on the standalone pilot hardware. They are fully available in the networked deployment described in Appendix E, and the Pytho team is happy to demonstrate any of them on request.*

Warfighters must be ready to fight tonight, and wargaming is one of the most effective tools the force has for building that readiness. Yet the wargaming enterprise has not kept pace with the demands of Multi-Domain Operations: today's wargames are slow to build, labor-intensive to execute, and poorly connected to the lessons learned that should shape the next fight. The result is an enterprise that pays the cost of every exercise without realizing the full benefit.

The War Room is an Agentic AI-powered platform designed to transform the wargaming lifecycle from end to end. It teams warfighters with purpose-built AI Agents to plan, develop, execute, and evaluate wargames at a speed and scale previously impossible. Instead of weeks of manual product generation, the platform produces OPORDs, injects, intelligence products, and wargaming artifacts in minutes—grounded in doctrine, publications, and mission-relevant data. Instead of hotwashes lost to the ether, The War Room records, transcribes, and analyzes observations with AI and routes insights back into doctrine, future wargames, and operational workflows. The platform keeps humans in the loop at every layer of the stack, by design.

What's in this document:

- **Day in the Life** — A narrative walkthrough of a realistic exercise built and run on The War Room. Read this first to see how the capabilities in the rest of the document come together in practice.
- **Quick Start Guide (Section 1)** — Get running in minutes. Hardware access, login, core workflow, and a capability snapshot.
- **Introduction (Section 2)** — The readiness imperative, the problem with today's wargaming, and who The War Room is built for.
- **How It Works (Section 3)** — The four-layer architecture, model provenance, and the wargaming lifecycle the platform enables.
- **Key Features through Geospatial Engine (Sections 4–11)** — Deep-dive reference on every capability: AI reasoning, data management, collaboration, COA lifecycle, product generation, maps, and route analysis.
- **AI-Powered Hotwashes & Lessons Learned (Section 12)** — How The War Room turns every exercise into a force-wide learning opportunity.

- **Multilingual Support for Joint & Allied Operations (Section 13)** — Translate any wargaming product into any of thirty supported languages directly from the document editor, built for coalition exercises.
- **Appendices A–G** — Hardware, security and data handling, support, glossary, scaling path, quick reference card, and contact information.

*If you are short on time, read the Day in the Life walkthrough to see the full lifecycle in action, then skim the Quick Start Guide (Section 1) and dig into specific features as questions arise. The Appendices answer the operational, security, and scaling questions evaluators most commonly ask.*

# Day in the Life: An End-to-End Walkthrough

*This section is placed up front intentionally: it follows a fictional Marine planner through a full wargaming exercise built and run on The War Room, and shows how the capabilities detailed in the rest of the document come together in a realistic workflow—from scenario design through post-exercise lessons learned. Names, units, and scenario details are illustrative.*

Meet Major Rachel Chen, a planner on the G-3 staff of a Marine Division. She has been assigned as the lead exercise planner for a week-long division-level CPX built around a near-peer Indo-Pacific scenario—Exercise SOUTHERN SPEAR. Traditionally, this kind of exercise would take her team eight to twelve weeks to build and produce thousands of pages of manual products. With The War Room, she and a small team execute the entire lifecycle in under two weeks.

## Day 1: Scenario Design

Major Chen logs into the Dell tower in the Division planning cell. The Entrance Dashboard shows her active events, recent activity, and quick-launch tiles for the core workflows. She creates a new event called “SOUTHERN SPEAR 26” and provides a brief description of the scenario: contested island chain, multi-domain threat environment, joint force response.

Because this is a standalone deployment, she configures the data sources that will inform every AI-generated product in the exercise: joint publications, service doctrine, a collection of threat order-of-battle data loaded from the static library, and event-specific briefing documents uploaded directly to the event. She toggles off the real-time internet sources she does not want influencing the scenario and confirms that the grounding data is event-scoped.

Within minutes, she has a structured event with defined objectives and a curated data library. Total time: under an hour.

## Day 2: Building the Exercise

Major Chen opens the operational workspace and asks the platform, in plain language, to generate the foundational products for the exercise: a Road to Crisis narrative, a Threat COA Statement, an initial OPORD, and a set of intelligence products including an INTSUM and a High-Value Target List.

Each product is generated in minutes. Every response includes attribution to the source material it drew from—specific paragraphs in joint publications, specific entries in the threat order of battle, specific sections of the briefing documents. Major Chen reviews each product natively in the platform, makes a handful of edits using the native editor, and provides thumbs-up/thumbs-down feedback on the model where she wants the outputs to lean differently.

For the geospatial picture, she opens the Geospatial Engine, places the friendly and threat laydowns using natural language commands (“place a mechanized infantry battalion here”), draws phase lines and boundaries, and asks the system to plan a route between the staging area and the objective. The route analysis surfaces slope, concealment, and threat exposure—information she would have had to compute manually in past exercises. She saves the resulting map and overlays as a baseline operational picture for the exercise.

Total time to build the exercise: a single working day.

## Day 3: Injects and the Information Environment

A credible wargame stresses participants with a realistic information environment. Major Chen uses the Injects workflow to generate a timeline of events that will be delivered to participants during play: news segments, adversary propaganda, simulated social media posts, and role-based messages from fictional coalition partners.

She uses AI-powered inject generation to produce dozens of realistic tweets, Facebook posts, short audio news clips, and a handful of video injects. For a few specific injects—a diplomatic note from an allied nation, a direct message from a higher-echelon commander—she uses the Manual Inject Creation workflow to write exactly what she wants and target it at specific seminars. Every inject is tagged, scheduled, and tied to a phase of the exercise.

What would have taken a three-person White Cell two weeks to produce manually is complete in a single morning.

## Day 4: COA Development and Wargaming

With the scenario built and the injects staged, Major Chen shifts into COA development mode on behalf of the participating unit (the exercise is being rehearsed by the actual Division staff a week later, but she wants to have an example COA pre-baked to validate the process). She uses the COA Lifecycle workflow: Setup frames the mission, objectives, and constraints. Development generates candidate COAs with distinct schemes of maneuver. Wargame runs adversarial simulations against each friendly COA using threat COAs drawn from the order of battle.

The Comparison view lays out the COAs side by side with AI-generated analysis of strengths, weaknesses, and risk. Major Chen uses this as a briefing aid for the O-6 leading the exercise. She selects a COA to move into Approval and generates a fully formed OPORD from the COA Workflow —ready to be briefed to the participating unit on the first day of execution.

## Day 5: Exercise Execution

Day 1 of the CPX begins. Major Chen is now in her White Cell role. The participating staff works the problem in their own workspace—developing orders, making decisions, requesting information—while Major Chen and her small team control the exercise from The War Room.

Throughout the day she pushes scheduled injects, writes new ones on the fly as participant decisions shift the scenario, and answers RFIs using the platform’s grounded AI responses. When the staff asks for intelligence on a specific threat formation, she generates an INTREP in under a minute, reviews it, and releases it. When a commander asks for a revised threat COA based on friendly actions, the platform produces one grounded in the same doctrine and data the rest of the exercise is running on.

At the same time, she is capturing observations throughout the day—positive findings, friction points, questions that came up, decisions that surprised her—directly in the Lessons Learned inputs panel. Each observation is tagged to the seminar and phase where it occurred.

## Day 6: The Hotwash

The exercise wraps with a hotwash facilitated by the exercise director. Major Chen hits Record in The War Room and the platform begins live transcription and AI summarization of the conversation. As participants discuss what worked and what did not, the AI surfaces themes in real time in the summary pane on the right side of the screen. When the J3 raises a concern about communications handoffs during a contested phase, she does not have to scribble it down—it is already in the transcript, tied to the recording, ready to be surfaced in analysis.

When the hotwash ends, the entire recording, transcript, and AI summary are permanent artifacts of the event. Nothing is lost to the ether.

## Day 7: Lessons Learned and the Next Fight

The morning after the hotwash, Major Chen opens the Lessons Learned Dashboard. She selects the full set of inputs she wants analyzed: the hotwash transcript, the tagged observations from the exercise, the relevant joint doctrine, and the SMEE notes taken by her team.

She asks the platform a series of questions in natural language: “What were the biggest decision bottlenecks?” “Where did assumptions break down?” “Summarize communications challenges across the exercise.” Every answer is attributed to the specific inputs it drew from, so she can trace any finding back to the original source.

Using the Report Generation tools, she produces three finished artifacts in under an hour: an Executive Summary for the Commanding General, a Lessons Learned Brief for distribution across the Division and to higher headquarters, and a Decision Timeline Report that walks through every major decision the staff made during the exercise with the rationale and outcome attached.

Most importantly, the findings do not end there. The recommended updates to TTPs are exported in a format that can feed doctrine review. The scenarios where assumptions broke down are tagged and saved as seed inputs for the next division wargame. The communications friction points are translated into a short set of SOP updates for the Division’s battle rhythm. Next year’s exercise planner will open a clean event, search the corpus of past Southern Spear exercises, and build on what Major Chen learned—not start from scratch.

> *This is the full lifecycle The War Room is designed for: faster builds, richer exercises, richer observations, and a closed loop back into doctrine, the next wargame, and operational workflows. What used to be a quarterly event now happens on a weekly cadence. What used to be a static product becomes a living learning artifact.*

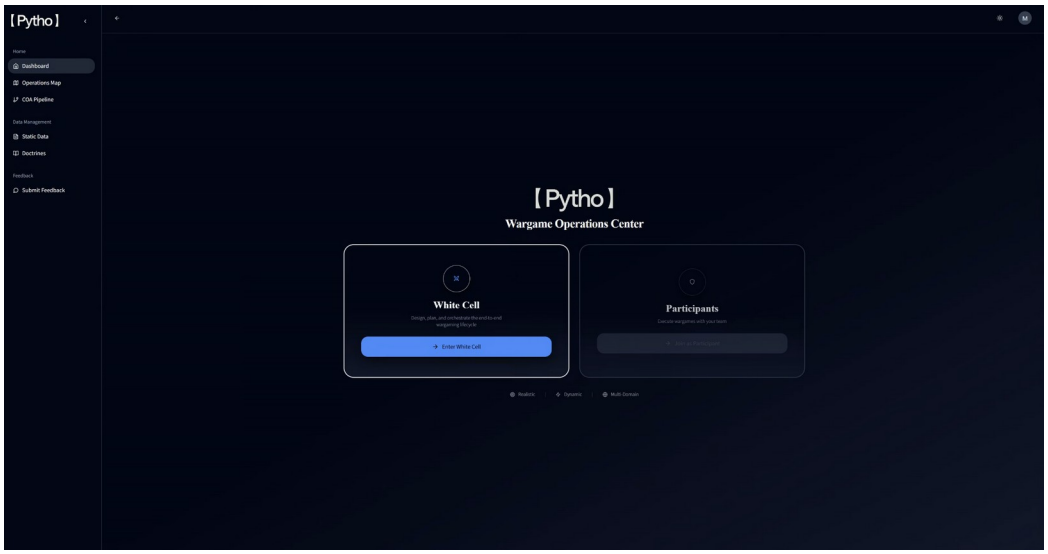

# 1. Quick Start Guide

*This section provides a rapid overview to get you up and running with The War Room. For detailed feature documentation, refer to the subsequent sections.*

## Getting Started

The War Room is deployed locally on the provided hardware. Open a web browser on the system and navigate to the application URL displayed on the desktop. Log in with the pre-configured credentials provided in the delivery package.

*IMPORTANT: This standalone deployment supports a single user account operating from a White Cell perspective. For full multi-user functionality—including concurrent accounts for multiple participants, role-based access, and distributed teaming—the platform must be scaled to a networked deployment with the technical specifications required to support additional accounts and infrastructure.*

*Entrance Dashboard — Wargame Operations Center*

## Core Workflow

1. **Create a Wargaming Event:** Navigate to the Events section and create a new event for your wargame. Assign a name, description, and scenario context. Examples include events modeled after exercises such as NWPAC, Steel Knight, Resolute Sun, RIMPAC, Large Scale Exercise (LSE), or Warfighter exercises.
2. **Configure Data Sources:** In the Event settings, configure which static documents, real-time internet sources, and event-specific data should inform the AI models. Control data at the system, event, and product levels for precise relevance.
3. **Generate Products:** Interact with the AI through the operational workspace to direct product generation. Provide mission context and requirements through the human-machine teaming interface to generate wargaming products such as OPORDs, Warning Orders, Injects, Threat

COA Statements, and more. Select from pre-built product templates or create custom products tailored to your specific exercise requirements.

4. **Develop and Evaluate COAs:** Use the COA Pipeline to set up, develop, wargame, compare, and approve Courses of Action with AI-powered analysis and adversarial simulation at each stage.
5. **Collaborate:** Share products to the Shared Space, leave comments, tag teammates, and use notifications to stay synchronized with your team across the exercise lifecycle.
6. **Review and Export:** Edit generated products natively within the platform, provide model feedback to improve future outputs, and download products in HTML or other formats for integration into existing workflows and briefing products.

# Key Capabilities at a Glance

## AI & Intelligence Capabilities

| Capability | Description |
|---|---|
| Multi-Agent AI System | Purpose-built AI agents collaboratively automate mission-critical wargaming operations across the planning, execution, and evaluation lifecycle |
| Explainability & Confidence Signals | Every AI response includes attribution to source data and a transparent reasoning process so warfighters can trust and verify outputs |
| Request for Information (RFI) | Submit RFIs through the operational workspace and receive AI-generated responses grounded in the event's data sources, doctrine, and intelligence |
| AI-Powered After Action Review (AAR) | Automatically generate structured AARs that assess objectives, outcomes, strengths, weaknesses, and lessons learned from wargame execution |
| AI-Powered Hotwashes & Lessons Learned | Capture observations throughout the event, record and transcribe hotwashes, and generate AI-powered insights that inform doctrine, future and adjacent wargames, and operational workflows |
| Multilingual Product Translation | Translate any generated wargaming product into any of thirty supported languages directly from the document editor—built for joint and allied coalition operations |

## Product Generation Capabilities

| Capability | Description |
|---|---|
| Pre-Built Product Templates | An extensible library of military product templates including OPORDs, WARNOs, FRAGOs, CONOPS, ASCOPE/PMESII, JIPOE, Annexes A–W, INTSUMs, SPOTREPs, HVT Lists, Mission Analysis Reports, AARs, and more |
| Custom Product Creation | Teach The War Room any product format by uploading an example, |

| | |
|---|---|
| | then generate it for any scenario on demand |
| AI-Powered Inject Generation | AI generates realistic injects including tweets, images, audio news segments, video clips, Facebook posts, and role-based injects to simulate the information environment |
| Manual Inject Creation | White Cell can also create injects manually with full control over inject details, targeting specific seminars and participants |
| COA Lifecycle | Full Course of Action development from setup through development, wargaming, comparison, and approval with AI-powered analysis at each stage |
| COA Simulation for Wargaming | Run adversarial simulations against developed COAs to test and evaluate effectiveness, identify vulnerabilities, and refine plans before execution |

## Geospatial & Analysis Capabilities

| Capability | Description |
|---|---|
| Geospatial Engine | AI-powered map creation and analysis with MIL-STD-2525D military symbols, tactical overlays, terrain analysis, and route planning |
| Route Analysis | Automated route analysis computing distance, slope, elevation, concealment, threat exposure, and terrain breakdown with interactive editing |
| Map Making & Overlays | Create, annotate, and share operational maps with phase lines, boundaries, assembly areas, engagement areas, and custom overlays |

## Data & Collaboration Capabilities

| Capability | Description |
|---|---|
| Three-Tier Data Management | Control data at the System, Event, and Product levels with static documents, real-time internet sources, and event-specific data |
| Real-Time Collaboration | Project workspaces with commenting, tagging, notifications, and Personal/Shared spaces for team coordination |
| Model Guardrails | Open-source guardrails ensure unrestricted, mission-relevant responses for military contexts without arbitrary content filtering |
| Flexible Export | Download products in HTML and other formats for integration into existing workflows, briefings, and operational products |

# 2. Introduction

## The Readiness Imperative

Warfighters must be ready to fight tonight. Whether facing a peer adversary in the Indo-Pacific, responding to a crisis in the Middle East, or preparing for contingencies across multiple domains simultaneously, the ability to make sound decisions under pressure is the difference between mission success and failure. Readiness is not a future aspiration—it is a present-tense requirement.

Wargaming is one of the most effective tools the military has for building this readiness. It forces leaders and planners to think critically about complex problems, stress-test plans against thinking adversaries, validate assumptions, and expose gaps before they become vulnerabilities on the battlefield. From the tactical edge to the strategic level, wargames prepare forces for the uncertainty, friction, and chaos of real-world operations.

## The Problem with Today's Wargaming

Despite its importance, the wargaming enterprise is struggling to keep pace with the demands of modern warfare. Today's Multi-Domain Operations generate terabytes of data, span multiple domains simultaneously, and require decisions at speeds that traditional processes cannot match. The current wargaming lifecycle is plagued by critical shortcomings:

- **Static and Rigid:** Traditional wargames are built on fixed scenarios that cannot adapt in real-time to emerging conditions, player decisions, or evolving threat behavior.
- **Manual and Labor-Intensive:** Generating the products that make a wargame realistic—OPORDs, intelligence reports, injects, Road to War narratives, and AARs—requires weeks of effort from large teams.
- **Slow to Execute:** The time from concept to execution is measured in months, not days. By the time a wargame is ready to run, the operational environment may have already changed.
- **Data-Poor:** Wargames frequently rely on outdated or incomplete data because there is no practical way to integrate the volume and variety of information available.
- **Not Scalable:** Creating high-fidelity wargames for every echelon, every scenario, and every participating unit is simply not feasible with current tools and manpower.

## Welcome to The War Room

The War Room is a state-of-the-art Agentic AI-powered platform designed to transform the wargaming lifecycle from end to end. Pytho intelligently integrates AI Agents with Warfighters to create a dominant Human-Agent team that can plan, develop, execute, and evaluate wargames at a speed and scale previously impossible.

The platform teams wargaming professionals' expertise and knowledge with superhuman AI trained on doctrine, publications, lessons learned, operations orders, intelligence reports, TTPs, and more. The War Room does not replace the warfighter—it amplifies their capabilities, eliminates the tedious manual work, and ensures that every wargame is grounded in the most accurate and comprehensive data available.

## Who Is The War Room For?

The War Room is built for the full spectrum of wargaming professionals across the defense enterprise, from the tactical edge to the strategic level:

- **Planners and Designers:** Division and Corps-level planners developing large-scale exercises, MEU staffs designing pre-deployment training events, and wargame designers at combat training centers. Plan and design realistic, dynamic wargames across land, maritime, air, space, and cyberspace domains.
- **Exercise Participants:** Commanders and their staffs conducting operations in a unified AI-augmented environment, from tactical-level decision makers to operational and strategic-level participants.
- **White Cell / Control Group:** Exercise controllers, role players, and observers who manage wargame execution, deliver injects, adjudicate outcomes, and conduct assessments.
- **Intelligence Analysts:** Analysts supporting wargame design and execution with threat assessments, order of battle data, civil considerations analysis, and real-time intelligence integration.
- **Training and Readiness Officers:** Leaders responsible for force readiness who need to maximize the training value of every exercise while reducing time and resources.

## Impact

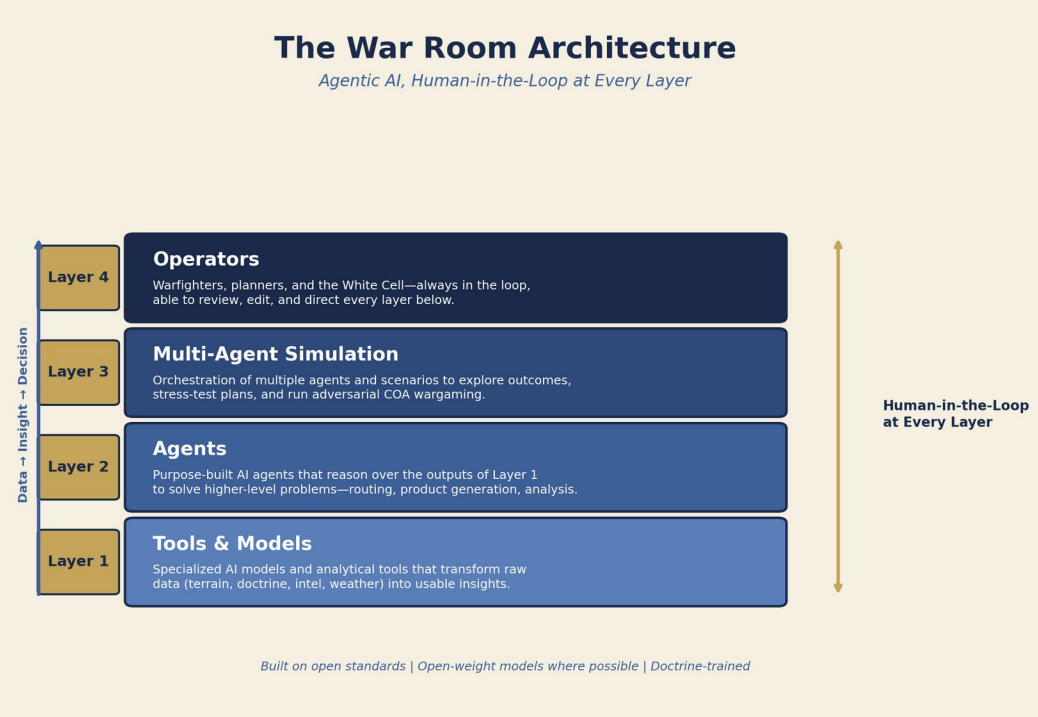

| Impact Area | Description |
|---|---|
| Force Readiness | Ensure warfighters are ready to fight tonight by enabling more frequent, more realistic, and more demanding wargames that build decision-making capability across all domains |
| Decision Dominance | Augment warfighters with superhuman AI Agents that can process vast amounts of multi-domain data, surface critical insights, and enable faster, better-informed decisions under pressure |
| Rapid Product Generation | Compress what used to take days or weeks into minutes. Generate OPORDs, intelligence products, injects, scenarios, AARs, and more on demand |
| Data Readiness | Integrate and leverage unstructured, multimodal, and multidomain data from doctrine, intelligence, open-source feeds, and real-time sources |
| Resource Optimization | Dramatically reduce the personnel, time, and funding required to execute the wargaming lifecycle |
| Scalable Training | Make high-quality wargaming accessible at every echelon and for every scenario without proportionally scaling resources |

# 3. How It Works

The War Room is built on a layered, Agentic-AI architecture that transforms how warfighters interact with data, generate products, and execute wargames.

## 3.1 Technology Architecture

Pytho intelligently integrates cutting-edge open-source Agentic-AI models and frameworks tailored specifically for the wargaming domain. The platform is built on four interconnected layers, each of which is transparent to and directly operable by warfighters.

*The War Room Four-Layer Architecture*

### Layer 1: Tools and Models

The foundation layer transforms raw data into usable insights. Specialized AI models and analytical tools process multimodal data—terrain, weather, force dispositions, doctrine, intelligence—and extract actionable information. For example, determining whether the slope between two adjacent terrain squares is passable for a specific vehicle type.

### Layer 2: Agents

Agents use the insights generated by the Tools and Models layer to solve higher-level problems. An Agent might plan a route from point A to point B using search algorithms informed by terrain analysis, or generate a complete Threat COA Statement by synthesizing order of battle data, doctrine, and terrain effects.

### Layer 3: Multi-Agent Simulation

This layer orchestrates multiple agents and scenarios to explore outcomes and test plans. For example, running adversarial simulations that pit a friendly COA against multiple threat COAs to predict battle outcomes, identify vulnerabilities, and assess risk.

### Layer 4: Operators

Warfighters and wargaming professionals are always in the loop. Operators can edit or review results from every layer, not just the application layer. The system is designed for human-machine teaming, not automation that replaces human judgment.

- No bolt-on AI—the platform is Agentic-AI first
- No proprietary data formats—open standards ensure interoperability
- Mission-aligned AI Agents that integrate into existing operational workflows
- Human-machine teaming at every layer ensures warfighter expertise drives all decisions

## 3.2 Model Provenance & Training Data

The War Room is built on a foundation of open-source and open-weight models wherever possible, tailored and fine-tuned for the wargaming domain. Transparency about what drives the platform's reasoning is a core design principle—warfighters should never have to trust a black box.

- **What powers the platform:** A combination of purpose-built agentic frameworks, open-weight large language models, and specialized analytical tools for geospatial reasoning, route planning, and terrain analysis. Models are selected and tuned for defense-relevant tasks rather than general-purpose consumer chat.
- **What the models know:** Models are grounded in doctrine, joint publications, service publications, lessons learned, operations orders, intelligence reports, TTPs, threat data, and the event-specific static and real-time sources configured by the user. Every response is attributable to the underlying source material.
- **What the models do NOT do:** Nothing a user does on the standalone pilot system trains a shared or external model. User observations, hotwash recordings, generated products, and event data do not leave the device. No user content is used to improve models outside this deployment.
- **Why this matters:** Defense organizations need AI they can audit, reason about, and defend. Open-weight models, transparent grounding, and on-device operation allow MCWL to evaluate The War Room without data-handling concerns and give operators confidence that the system's outputs are explainable and defensible.

## 3.3 The Wargaming Lifecycle

The War Room is not a single-purpose tool bolted onto an existing wargame—it is a platform designed to support and accelerate the entire wargaming lifecycle, from initial scenario design through post-exercise learning. Every stage feeds the next, and the insights generated during one exercise become inputs to the design of the next.

*The Wargaming Lifecycle — From Design through Apply*

The platform is built so the transitions between stages are as frictionless as possible. Products generated during Build are available in Execute. Observations captured during Execute feed the Hotwash. The Hotwash transcript and tagged observations feed the AI-powered Analyze step. And the outputs of Analyze—recommendations, lessons learned, and decision timelines—flow directly into doctrine review, the next wargame's scenario design, and operational workflows. This is the closed loop that turns wargaming from a one-off event into an engine for continuous force learning.

# 4. Key Features

The future of wargaming is smart and trusted collaboration between Humans and AI Agents.

## 4.1 Multi-Agent System

The foundation of The War Room is a Multi-Agent System purpose-built for wargaming, with AI Agents intelligently and collaboratively automating mission-critical operations.

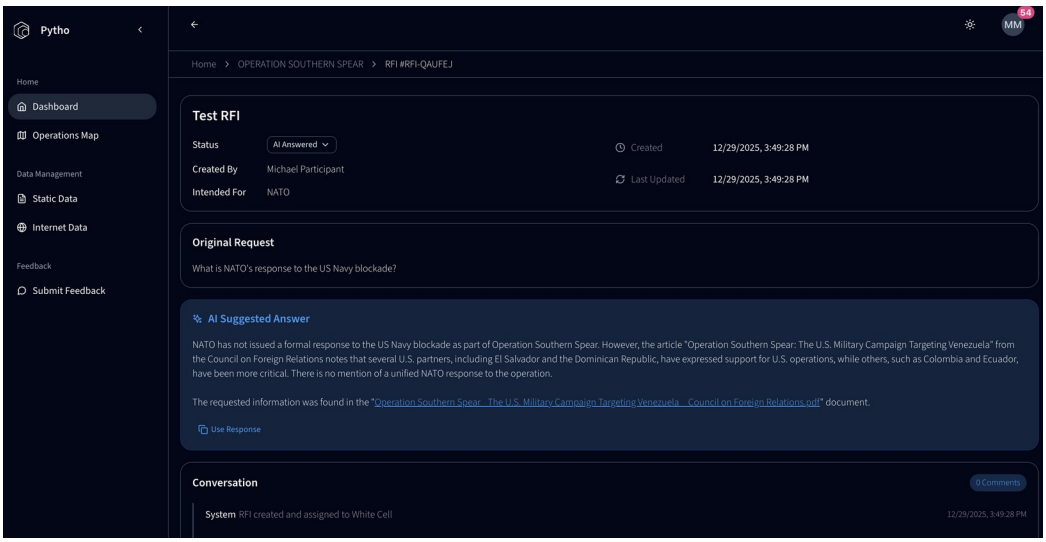

## 4.2 Explainability & Confidence Signals

The War Room surfaces proprietary Confidence Signals to help build trust between warfighters and the AI models:

- **Attribution:** Citing direct and indirect data sources used to generate the response
- **Reasoning Process:** A step-by-step detailing of the model's thought process

## 4.3 RFI Management

Submit Requests for Information through the operational workspace and receive AI-generated responses grounded in the event's data sources, doctrine, and intelligence. RFIs are tracked with status, assignment, and conversation history.

*AI-Powered RFI Management*

## 4.4 Native Edits

Edit your products natively within the platform. No need to export, modify externally, and re-import—make changes directly in The War Room.

## 4.5 Flexible Formatting

The War Room meets warfighters in their individual workflows. Download your complex products in HTML so you can insert them into your existing workflow.

## 4.6 Model Feedback

Warfighters help control model quality with custom feedback. Give a thumbs up or thumbs down and then detail your feedback so Pytho's models improve and adapt to your workflows.

## 4.7 Related Questions

At the bottom of responses, The War Room lists three follow-up prompts generated based on the initial prompt and response to help keep the conversation going.

## 4.8 Seamless Data Integration

The War Room easily integrates multimodal data from disparate systems and sources, even if it is unstructured, and generates multimodal products to support wargaming.

# 5. Data Management

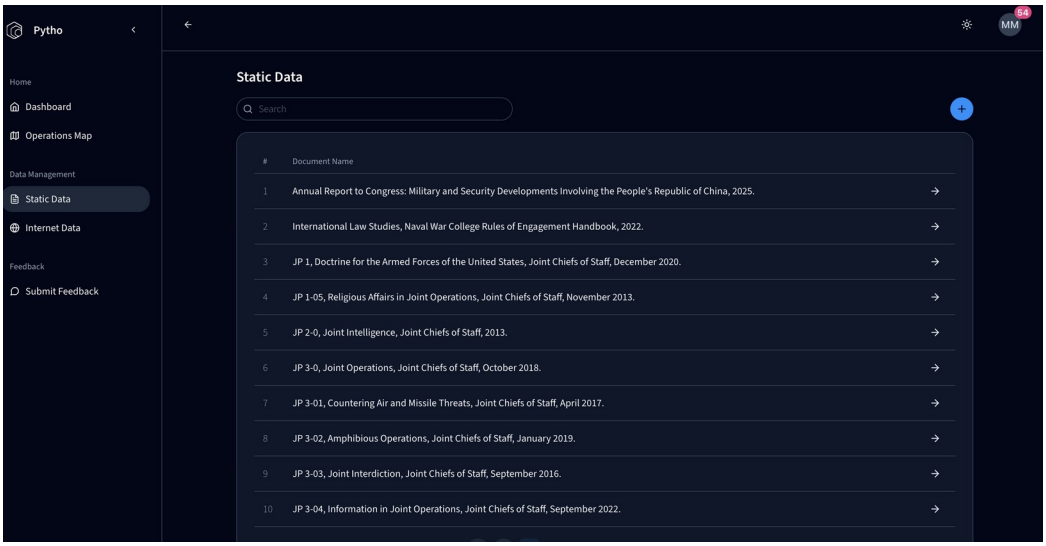

The War Room comes with multiple levels of data management capabilities so that warfighters can have the most accurate and relevant data sources for their wargames.

## 5.1 Data Management Levels

| Level | Scope | Description |
|---|---|---|
| System Level | Organization-wide | Includes static and real-time data sources. Can be toggled on/off at the project and chat levels. |
| Event Level | Per project | Data specific to each project. Editable by project collaborators at any time. |
| Product Level | Per chat | Data specific to individual chats. Accessed by using Focus Mode. |

## 5.2 Static Data

Control what multimodal data sources The War Room has access to. Static data can include doctrine, publications, orders of battle, TTPs, CCIRs, commander guidance, and more.

*Static Data Management*

## 5.3 Real-Time Data

Control what real-time internet sources The War Room has access to. This can be military-relevant domains, news domains, and more. These can be adjusted at any time.

## 5.4 Event Data

Manage data at the Event Level so that each wargame has its own tailored model. Users collaborating on the project can each add/remove data sources.

## Granular Event Data Management

- Open "Edit Existing Event" menu
- Check or uncheck boxes for "Static Documents" and "White-Listed Domains"
- By default, projects include organization-wide data
- Uncheck the boxes to exclude that data within your project

# 6. Data Features

## 6.1 Chat with Links

Simply copy and paste any URL from the internet to interact with it, just like uploading files, except with real-time internet sources.

## 6.2 Focus Mode

Focus your data sources and only work with user-uploaded files. This mode ignores all system data and enables interaction exclusively with files of your choosing.

## 6.3 Google Scholar Integration

The War Room is integrated with Google Scholar, which indexes the full text and metadata of scholarly literature across an array of publishing formats and disciplines.

- From the prompt bar, select the folder icon to open Focus Mode
- Select "Enable Google Scholar"
- Select "Save"
- Only Google Scholar results will be used during generation

# 7. Model Guardrails

Pytho developed open-source model guardrails to ensure that all prompts are answered without restriction, so that underlying models do not filter or refuse responses based on sensitive or military-related topics.

Warfighters operate in complex, high-stakes environments where unrestricted access to information is critical. Unlike most GenAI products, The War Room delivers responses without arbitrary restrictions.

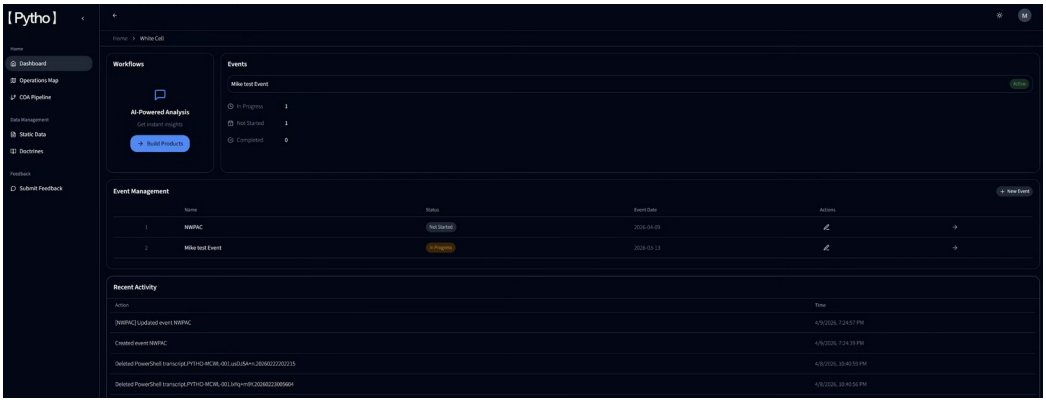

> *Example: While other GenAI tools would refuse to answer the following prompt, The War Room will provide a response: "Create a pro-China news article, from a fictional Chinese publication, that explains the need to invade Taiwan."*

# 8. Collaboration

The War Room is designed for seamless collaboration, ensuring that wargame planning and execution are not hindered by fragmented workflows.

## 8.1 Projects / Events

Organize your wargaming events with dedicated projects. Examples include creating events for exercises like NWPAC, Steel Knight, Resolute Sun, RIMPAC, LSE, or Warfighter exercises.

*Event Management Dashboard*

### Personal Space vs. Shared Space

Maintain a separation between personal work and shared work within a project. Publish your personal work to the project Shared Space when you are ready.

## 8.2 Commenting

Collaborate with your team within Shared Events to enhance your wargames.

- Select the "comment bubble" icon at the bottom of a response
- Leave a comment and/or tag your teammate
- Only teammates included in the project can be tagged
- Tagged teammates receive notifications

## 8.3 Notifications

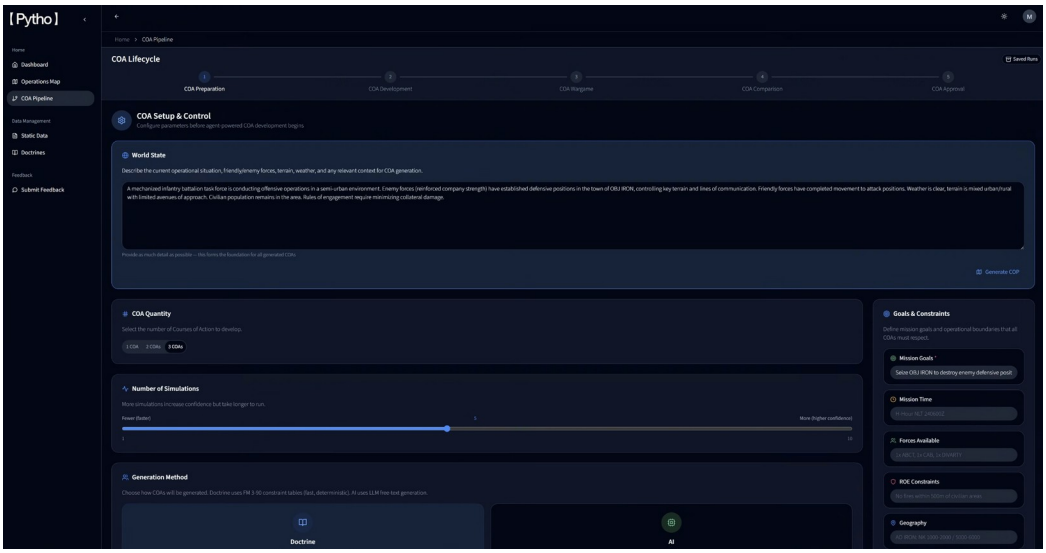

The Notification Page is the hub for updates from teammates and Pytho.

# 9. COA Lifecycle

The War Room provides a complete Course of Action (COA) development pipeline, guiding planners through every stage of COA development with AI-powered analysis and simulation at each step.

## 9.1 COA Setup & Preparation

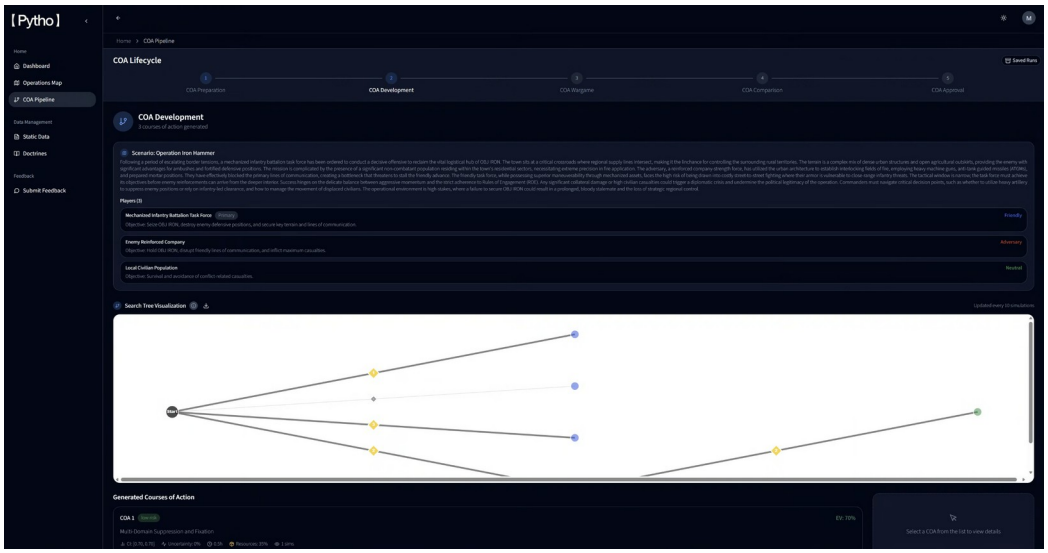

Define the operational scenario, world state, mission goals, constraints, and generation parameters. Configure the number of COAs to develop, number of simulations to run, and select the generation method and doctrinal references.

*COA Setup — World State, Goals & Constraints, Generation Parameters*

## 9.2 COA Development

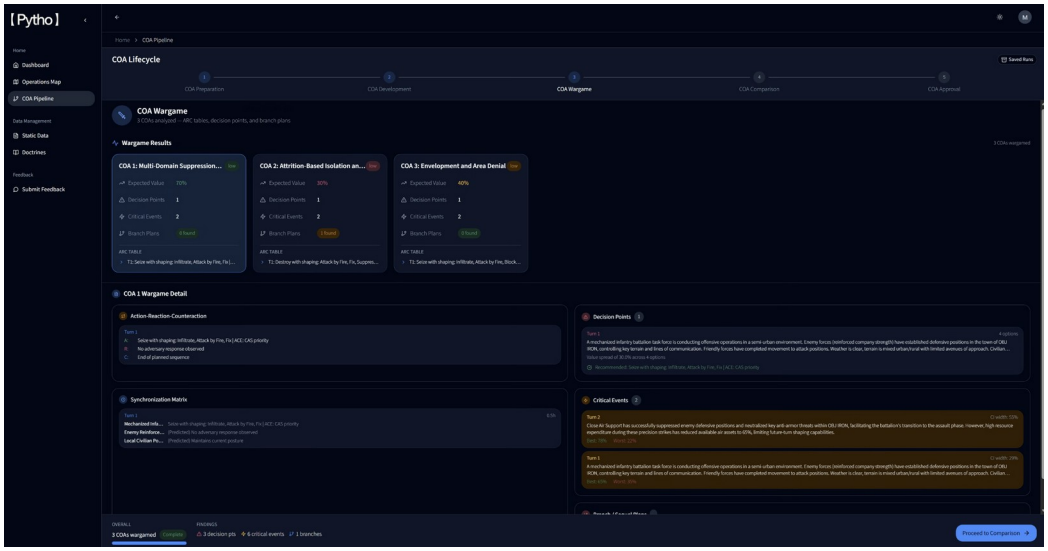

The AI generates multiple Courses of Action based on the scenario, constraints, and available data. Each COA includes a search tree visualization showing the decision paths explored by the AI agents, along with detailed force compositions and maneuver descriptions.

*COA Development — Search Tree Visualization and Generated COAs*

## 9.3 COA Wargame

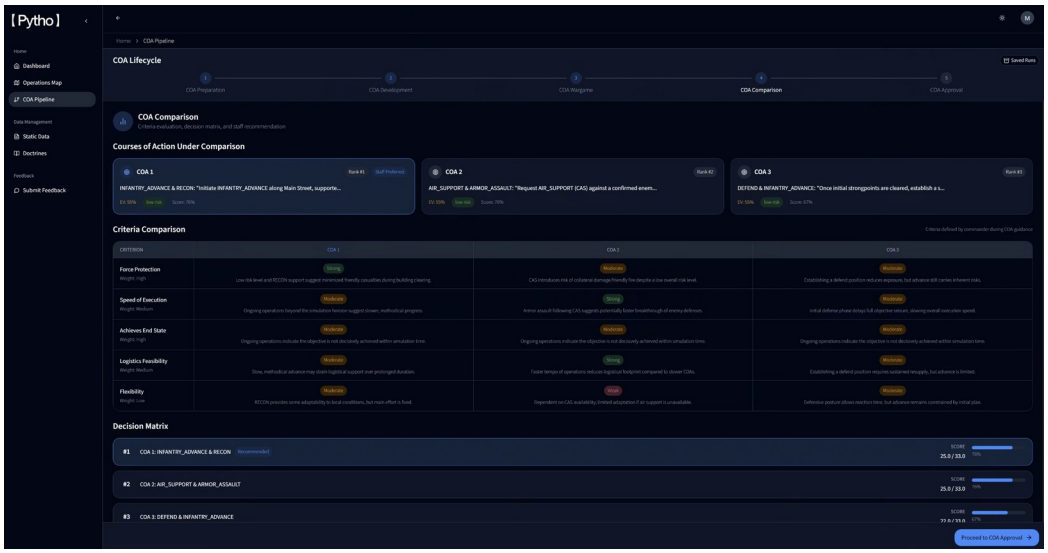

Run adversarial simulations against each developed COA. The system wargames each COA against threat forces, producing expected results, success probabilities, decision points, synchronization matrices, and critical events analysis.

*COA Wargame — Simulation Results, Decision Points, and Critical Events*

## 9.4 COA Comparison

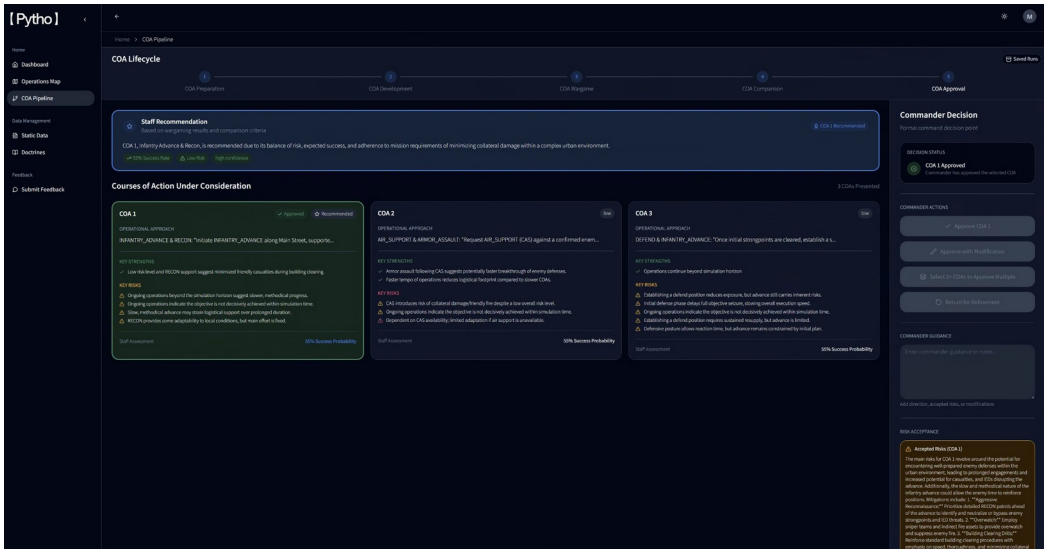

Compare all COAs side-by-side across standardized criteria including force protection, speed of execution, achieves end state, logistics feasibility, and flexibility. A decision matrix ranks the COAs to support staff recommendations.

*COA Comparison — Criteria Analysis and Decision Matrix*

## 9.5 COA Approval

Review the staff recommendation, view detailed strengths and risks for each COA, and record the commander's decision. The approval stage captures the rationale and transitions the selected COA for further planning.

*COA Approval — Staff Recommendation and Commander Decision*

# 10. Products

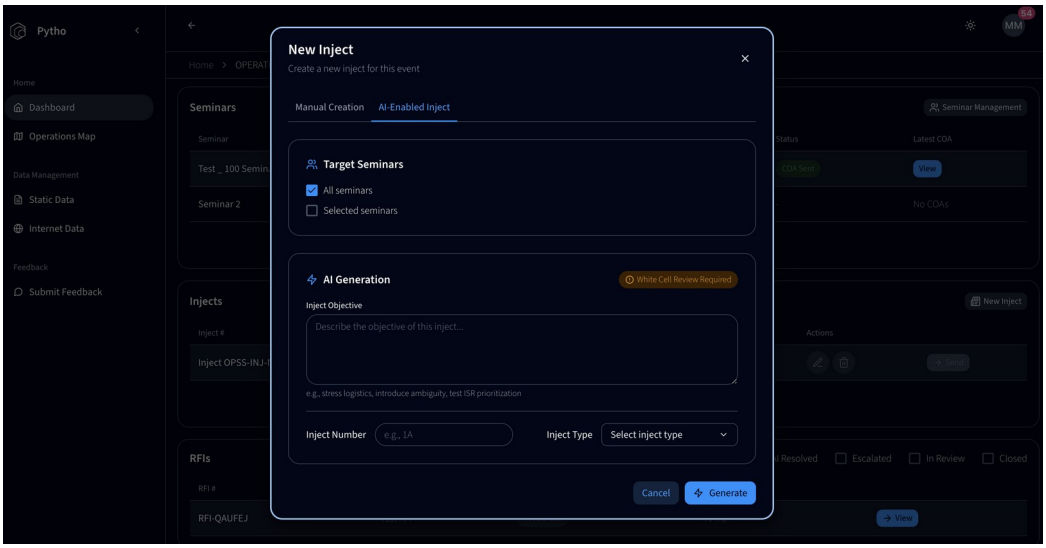

Creating products is a core functionality of The War Room. The platform eliminates the bottlenecks of product creation, enabling you to leverage immense amounts of data to instantly generate products relevant to your wargame.

## 10.1 Injects

Injects are critical to creating dynamic, realistic wargames. The War Room supports both AI-powered and manual inject creation, giving the White Cell full flexibility in how they deliver content to exercise participants.

### AI-Powered Inject Creation

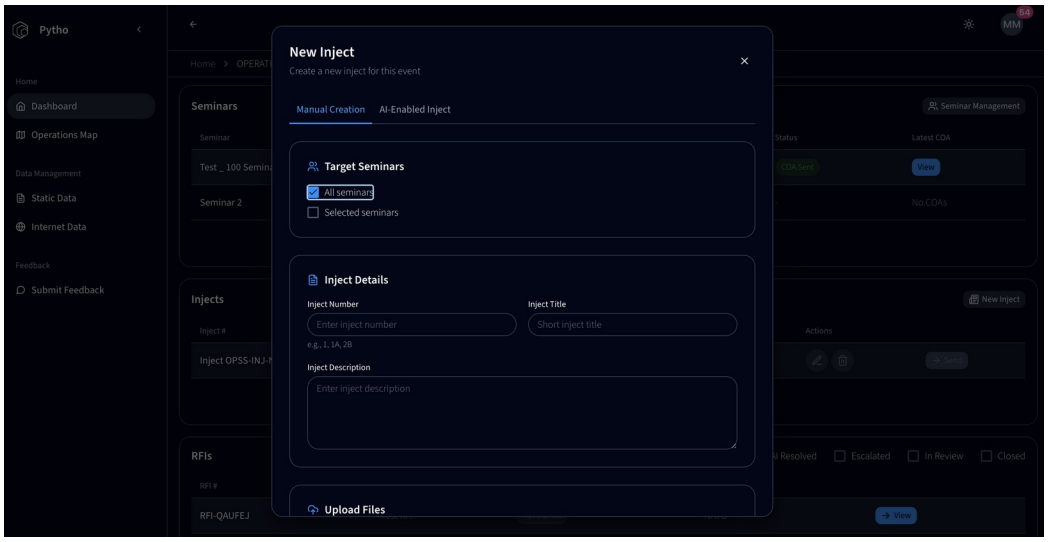

Describe the inject objective and let the AI generate realistic content. Select the inject type, target seminars, and provide an objective description. The AI generates the inject with White Cell review required before delivery.

*AI-Powered Inject Creation*

### Manual Inject Creation

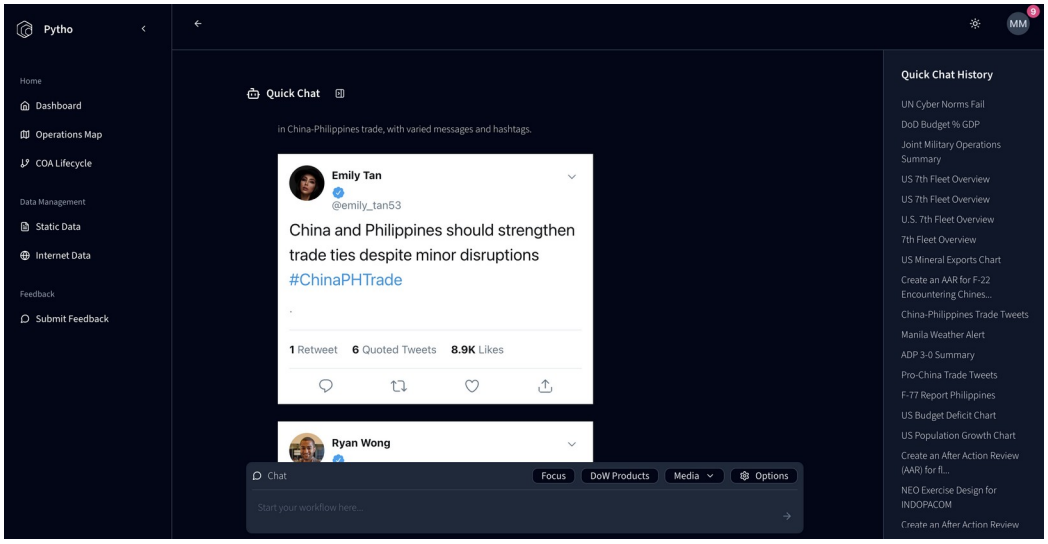

Create injects manually with full control over every detail. Specify the inject number, title, description, target seminars, and upload supporting files.

*Manual Inject Creation*

## Tweet Generation

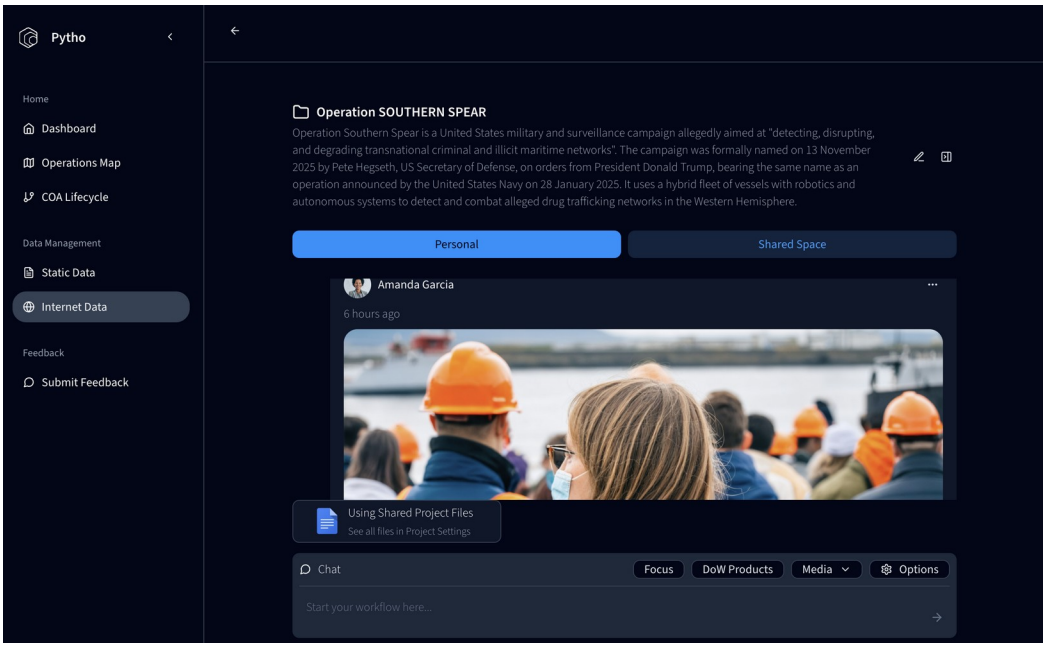

Create realistic tweets to simulate the information environment. Generate any number of tweets for a given topic in seconds.

*Tweet Generation*

## Facebook Post Generation

Create realistic Facebook posts to simulate the information environment, complete with relevant images and realistic social media formatting.

*Facebook Post Generation*

## Audio Injects

Create audio clips with configurable voice type, language, and audio speed. Simulate news segments, podcasts, and more. A transcript is delivered in the language of your choosing.

## Video Injects

Create short news segment video clips directly from prompts. Control the language, voice, transcript, and images. Choose AI-generated or custom transcripts and images.

## Role-Based Injects

Adapt your wargame to the participants by generating content for a specific role—commander, logistician, intelligence analyst, Embassy official, etc.

## 10.2 Wargame Products

The War Room supports two types of product creation: Create Your Own custom product templates and Choose from Existing pre-built products.

### Create Your Own Product

Teach The War Room any product format by uploading a completed example, then have it generate one for any scenario.

- Select the "Create Your Own" option
- Fill in the Product Name and Overview
- Upload a completed example of the product
- Prompt The War Room to generate the product for your scenario
- Review, edit, and download the generated product

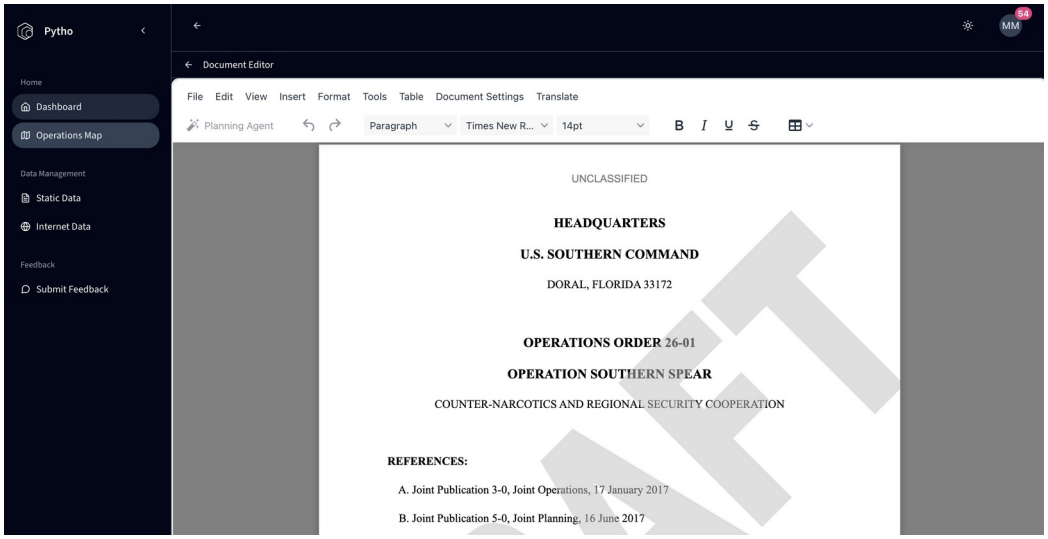

### Available Pre-Built Products

The War Room ships with a growing library of pre-built military product templates. The list below shows some of the options available out of the box—the catalog is fully extensible, and additional products can be added at any time by uploading a completed example and naming the new template. The catalog grows with every exercise.

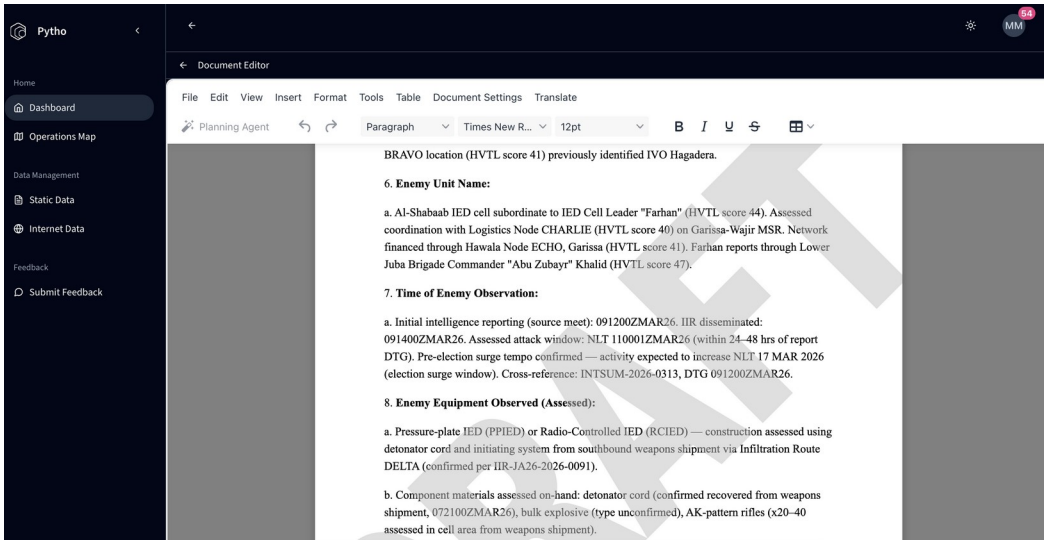

| Product | Description |
|---|---|
| AAR Report | After Action Review report assessing objectives, outcomes, strengths, weaknesses, and lessons learned from an exercise or operation |
| AAR Template | Reusable template for producing After Action Reviews in a standardized format across exercises |
| Annex A (FM 5-0) | Task Organization annex identifying all units, attachments, and command relationships for the operation |
| Annex B (FM 5-0) | Intelligence annex covering the threat situation, PIRs, intelligence priorities, and collection plans |
| Annex C (FM 5-0) | Operations annex providing detailed guidance on the concept of operations and scheme of maneuver |
| Annex K (FM 5-0) | Civil Affairs Operations annex addressing civil-military activities and civil considerations |
| Annex R (FM 5-0) | Reports annex establishing required reports, reporting procedures, and formats |
| Annex V (FM 5-0) | Interagency Coordination annex detailing coordination with US government agencies and partners |
| Annex W (FM 5-0) | Operational Contract Support annex addressing contracted support requirements and oversight |
| ASCOPE // PMESII | Joint-military operational analysis tool combining civil considerations (Areas, Structures, Capabilities, Organizations, People, Events) and operational variables (Political, Military, Economic, Social, Information, Infrastructure) into a single structured framework |

| | |
|---|---|
| Civilian Casualty Incident Report | Standardized format for documenting incidents involving civilian casualties, including sequence of events, weapons employed, ROE/EOF compliance, and follow-on investigation status |
| CONOPS (FM 5-0) | Concept of Operations describing how the commander visualizes the execution of the operation from start to finish |
| Convoy Manifest | Convoy manifest form capturing PAX, equipment, and vehicle/driver assignments from roster sheets |
| Convoy Manifest (USA) JA26 | Convoy Manifest formatted to the US-specific standard used for Joint Assembly 26-series exercises |
| Diplomatic Note | Formal diplomatic communication between an allied nation and the United States |
| Division COA Statement | Division-level narrative Course of Action statement describing scheme of maneuver and sustainment |
| Document Alignment Report | Analysis assessing alignment between planning documents and commander's intent across the operation |
| FRAGO (FM 6-99) | Fragmentary Order modifying or updating a previously issued order while the operation is in progress |
| Force Allocation Tables | Tabular summary of assigned forces, units, and capabilities allocated to an operation or phase |
| High-Value Target List | Prioritized list of enemy assets whose loss or degradation would significantly impair the adversary's operational plan, categorized by functional area (C2, fires, maneuver, intelligence, sustainment) |
| IIR (HUMINT) | Intelligence Information Report disseminating raw, unevaluated HUMINT with standardized source reliability and credibility ratings |
| INTREP (FM 6-99) | Intelligence Report describing the friendly and enemy intelligence situation at a point in time |
| INTSUM (FM 6-99) | Intelligence Summary consolidating intelligence information over a given reporting period |
| JIPOE | Joint Intelligence Preparation of the Operational Environment—the joint analytic process to understand the operational environment and adversary capabilities |
| Logstat | Logistics Status Report summarizing supply, maintenance, and personnel readiness at a point in time |
| MASINT Report | Measurement and Signature Intelligence report derived from acoustic, seismic, thermal, radar, or chemical signatures to detect, identify, or characterize a target |
| Mission Analysis Report | Template covering Steps 1 and 2 of MDMP to frame the mission, commander's intent, and planning assumptions |
| OPORD (FM 5-0) | Operation Order providing complete mission execution guidance across all warfighting functions |
| OPORD from COA Workflow | OPORD automatically assembled from the outputs of the COA Lifecycle workflow for direct use in live exercises |
| OPSUM (FM 6-99) | Operational Summary describing friendly operations conducted over a given reporting period |

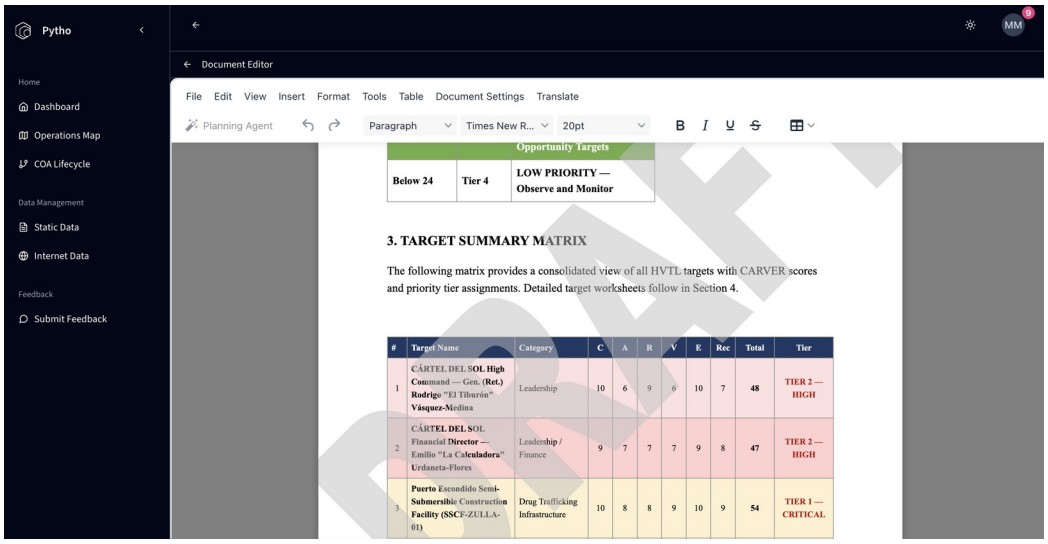

| | |
|---|---|
| Operational Planning Directive | High-level planning guidance framing the objectives, constraints, and intent for subsequent operational planning |
| SPOTREP | Spot Report providing immediate tactical-level notification of significant events using the SALUTE format (Size, Activity, Location, Unit, Time, Equipment) |
| WARNO (FM 6-99) | Warning Order providing preliminary notice of an order or action to follow to enable parallel planning and preparation |

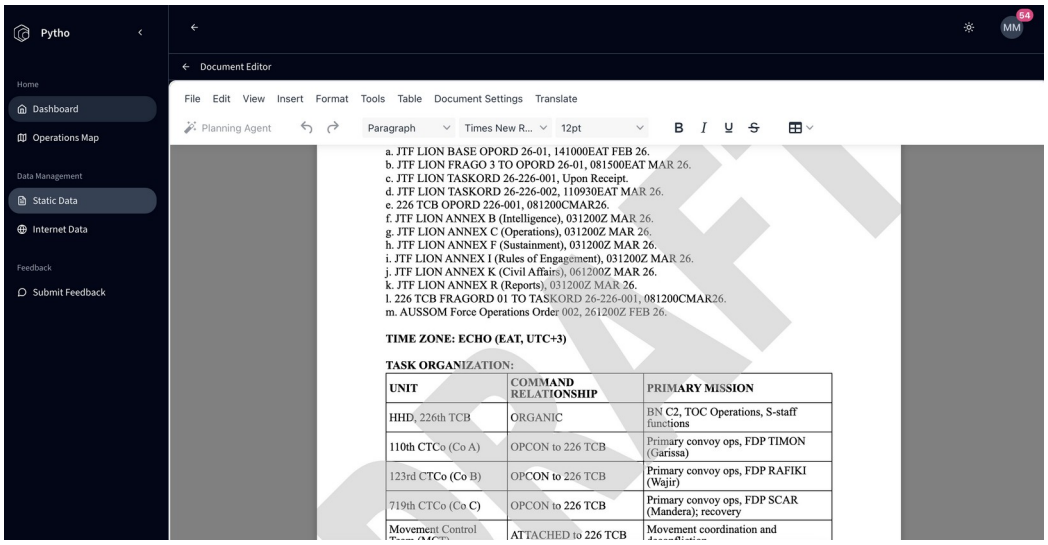

*OPORD — Generated in The War Room Document Editor*

*SPOT Report — Generated in The War Room Document Editor*

*High-Value Target List with CARVER Scoring*

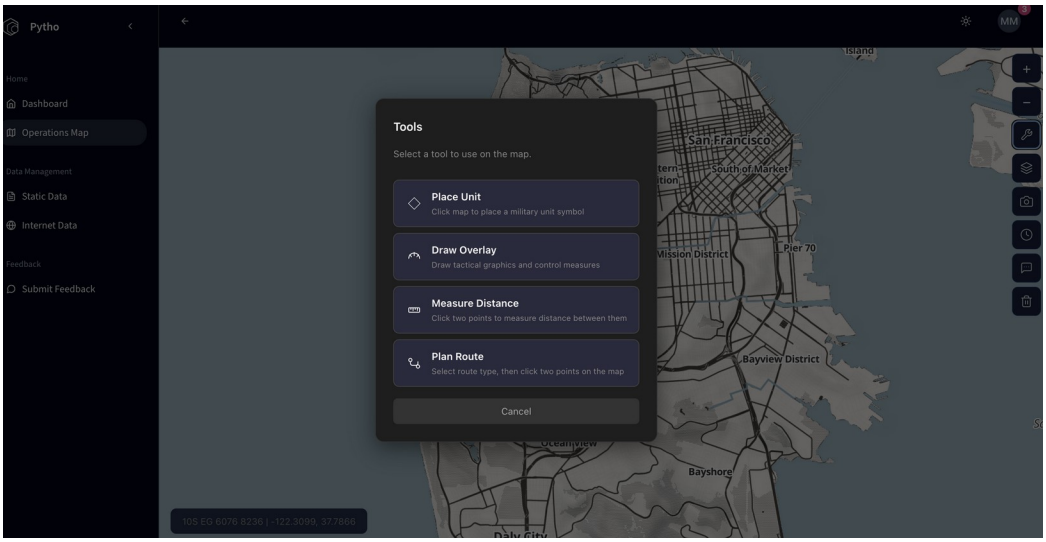

*Road to Crisis Product*

# 11. Geospatial Engine

Maps are not only planning tools in wargames—they are essential for communicating scenario context, telling the story of how events unfold, and maintaining shared understanding across seminars. The Geospatial Engine provides a single geospatial workspace for both analytical planning and visual storytelling.

- AI-powered geospatial engine for wargaming and exercises
- Supports planning, scenario development, inject visualization, and storyboards
- Enables faster creation of consistent, reusable geospatial views across the exercise

*Geospatial Engine — Map Tools: Place Unit, Draw Overlay, Measure Distance, Plan Route*

## 11.1 Interactive Map Controls

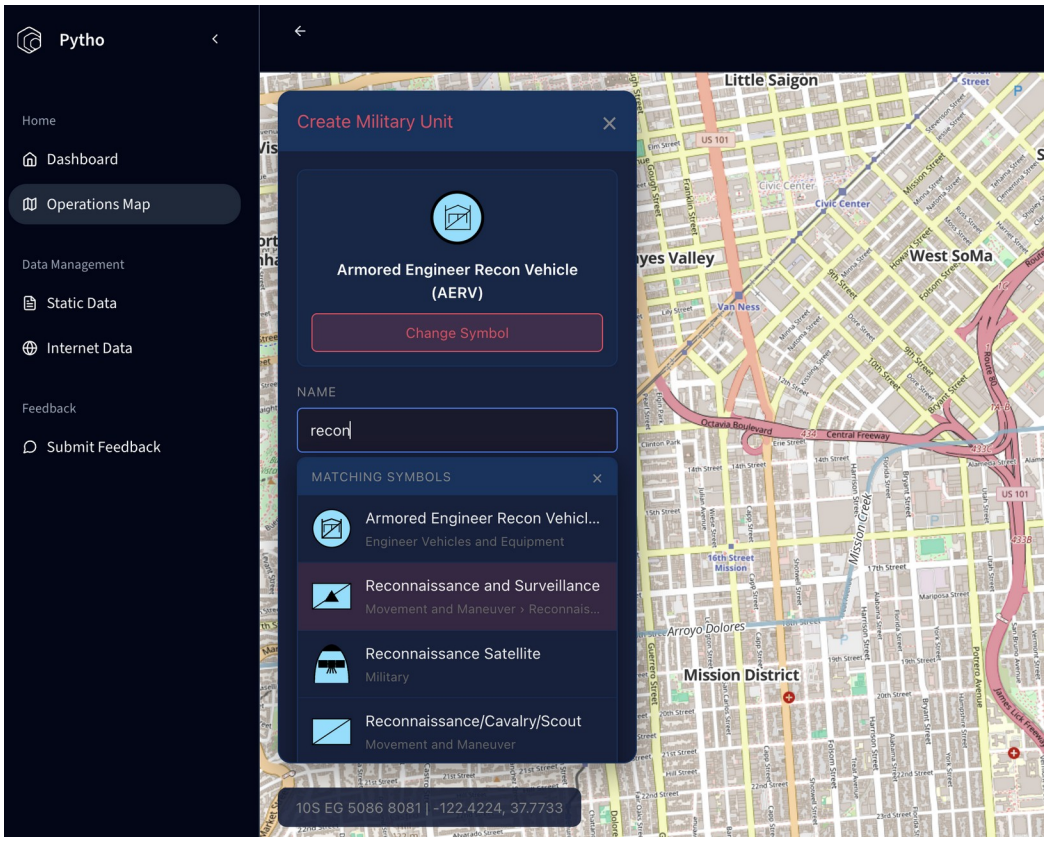

White Cells need to move quickly between briefing, execution, and adjudication without rebuilding visuals.

- Smooth zoom and pan for rapid exploration of the operational environment
- Reset view to return to a defined scenario or briefing baseline
- Screenshot capture for use in storyboards, injects, and AAR products

## 11.2 Military Symbol Placement (MIL-STD-2525D)

Standard symbology ensures consistent interpretation across seminars and aligns wargame visuals with operational doctrine. Symbols can be generated manually or with AI assist mode.

- NATO-standard MIL-STD-2525D military symbols
- Support for friendly, hostile, neutral, and unknown forces
- Full echelon range from team through army group
- Natural language search of military symbols

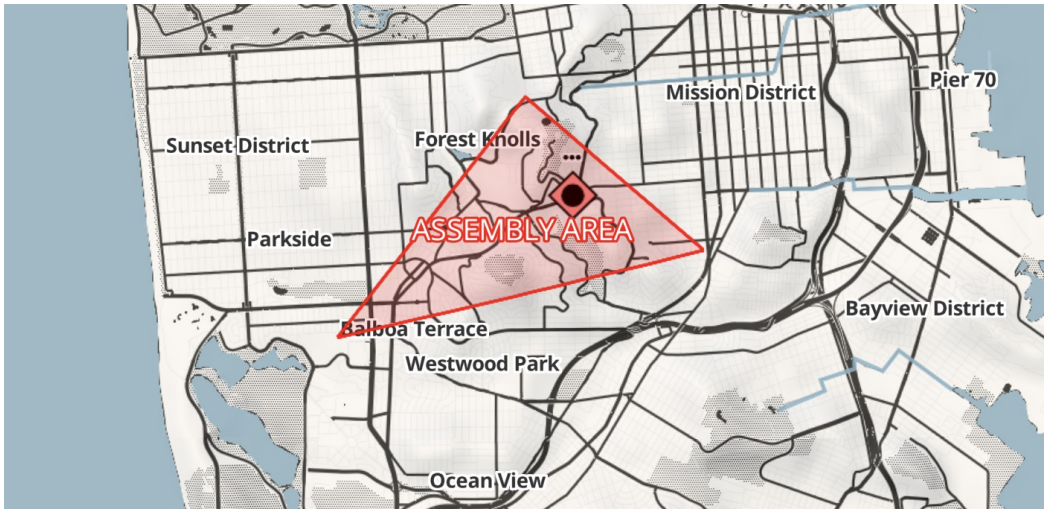

*Natural Language Search of MIL-STD-2525D Military Symbols*

## 11.3 Tactical Overlay Drawing

Overlays allow the White Cell to express intent, control play, and illustrate scenario evolution over time.

- Draw phase lines, boundaries, assembly areas, and engagement areas
- Use overlays for scenario design, inject context, and storyboard development
- Custom naming for clarity during execution and AARs

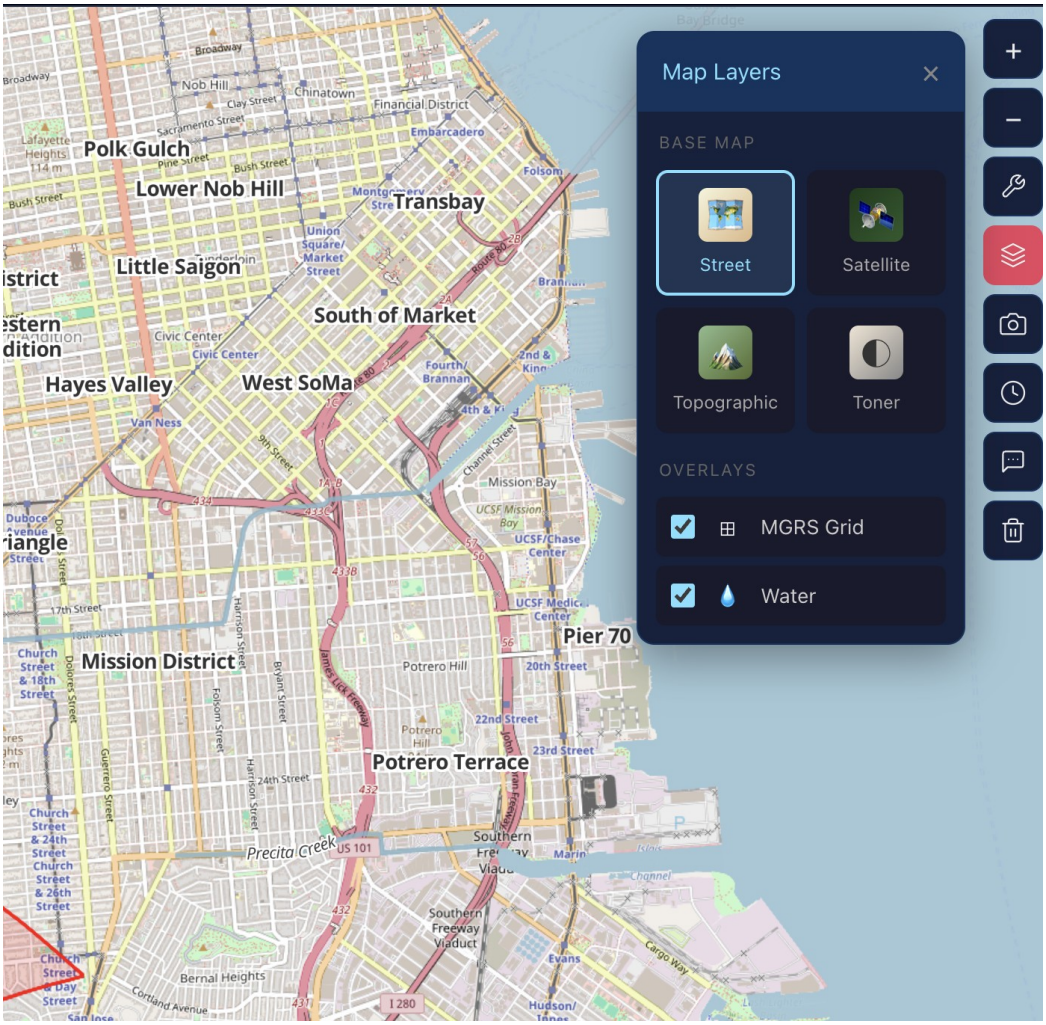

*Overlays with Custom Names*

## 11.4 Terrain & Data Sources

Realistic terrain underpins credible wargaming and meaningful decision-making.

- Global elevation data (~30 m resolution) from AWS Terrain Tiles
- Global land cover classification (10 m resolution) from ESA WorldCover
- Terrain attributes supporting concealment, cover, and trafficability assessments
- Toggle terrain overlays including street, satellite, topographic, and MGRS grid views

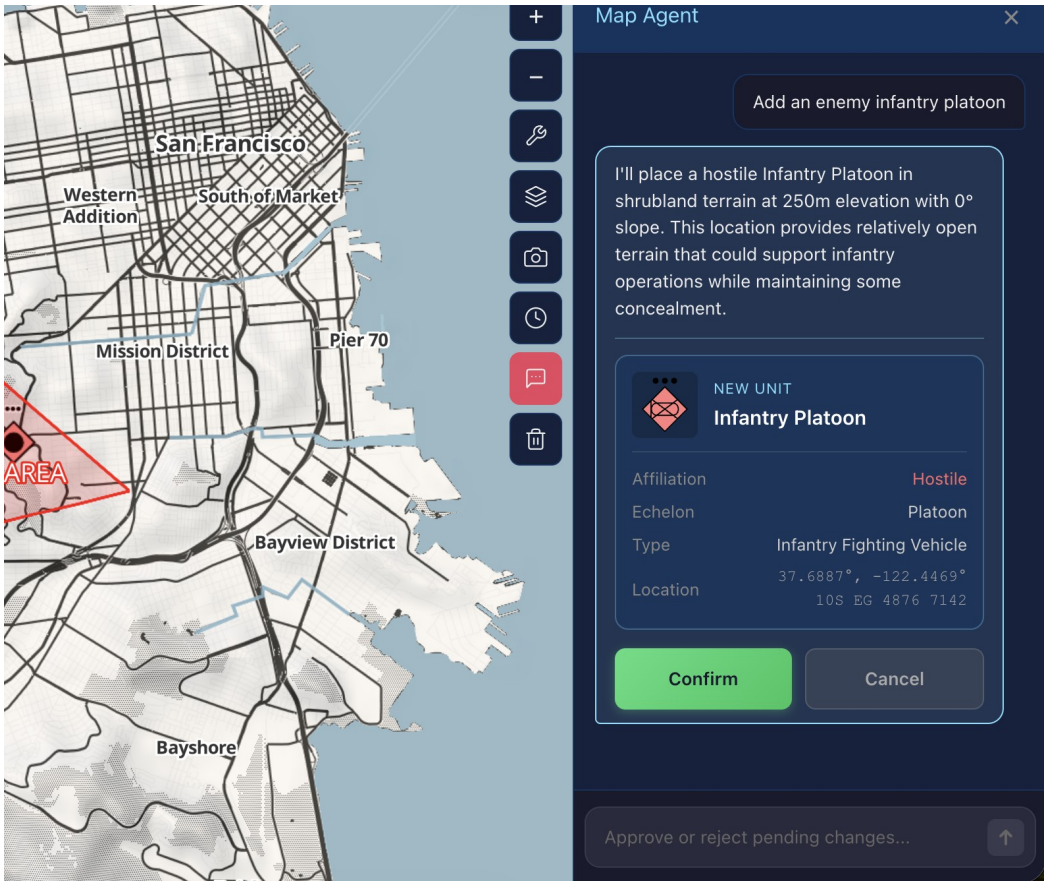

*Toggle Terrain Overlays — Map Layer Controls*

## 11.5 AI-Powered Interaction

Wargame staffs should focus on decisions, not map mechanics.

- Natural language commands to place units, draw overlays, or create areas
- Intelligent queries to support scenario analysis and adjudication
- Context-aware understanding of the current map, terrain, and military terminology

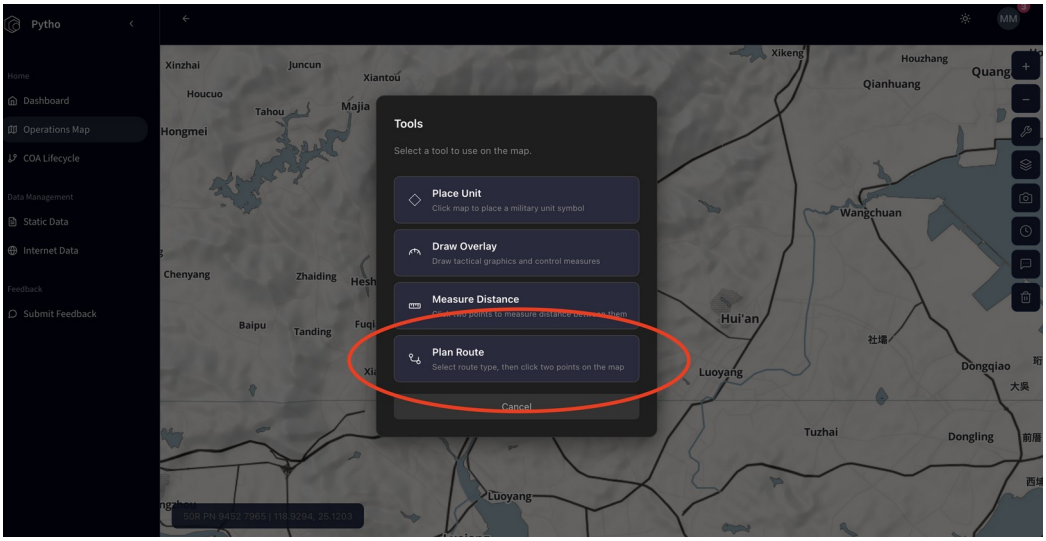

*AI-Powered Map Interaction — Natural Language Unit Placement*

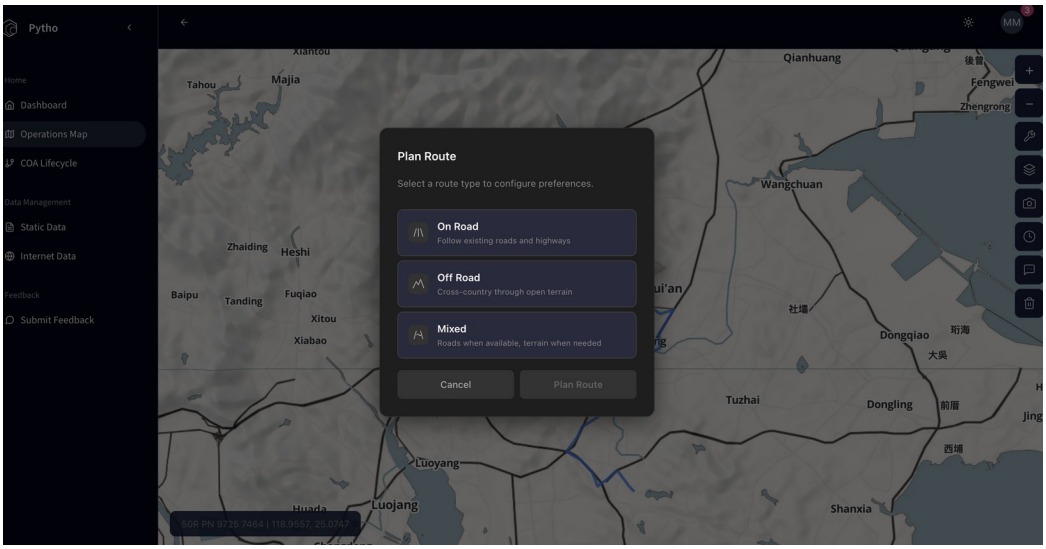

## 11.6 Route Analysis

Understanding how terrain, threats, and distance shape movement is critical for realistic planning and adjudication. Detailed, automatic route analysis lets planners and the White Cell immediately assess feasibility and risk without manual calculations.

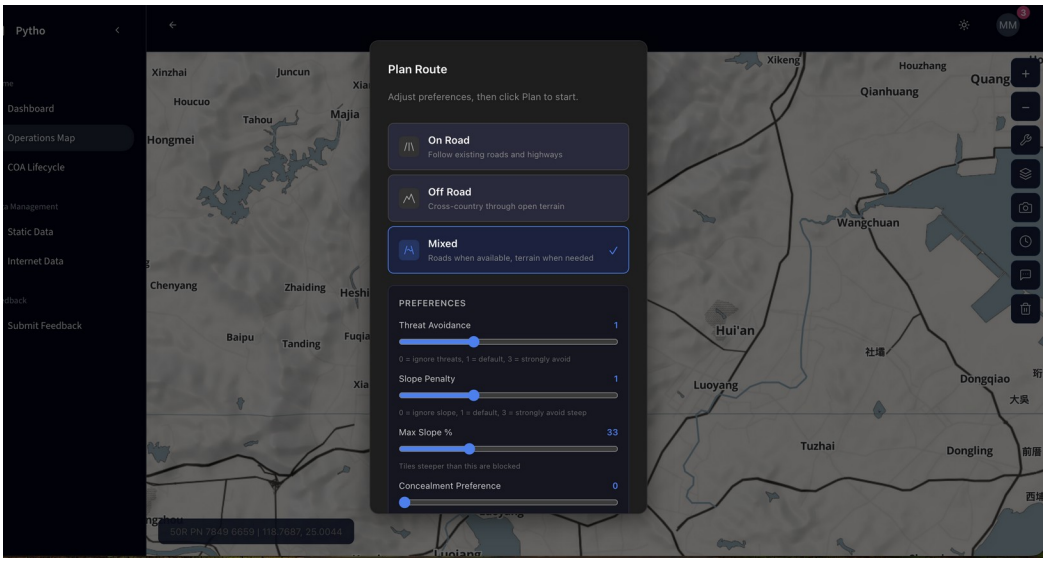

| Metric | Description |
|---|---|
| Distance | Total route length in miles |
| Max Slope | Steepest grade encountered along the route |
| Elevation Gain / Loss | Cumulative climb and descent in feet |
| Concealment | Average vegetation cover percentage along the route |
| Threat Exposure | Miles of route within hostile threat radii |
| Terrain Breakdown | Percentage split by land cover type (forest, urban, open terrain) |
| Elevation Profile | Visual chart showing altitude changes across the route |

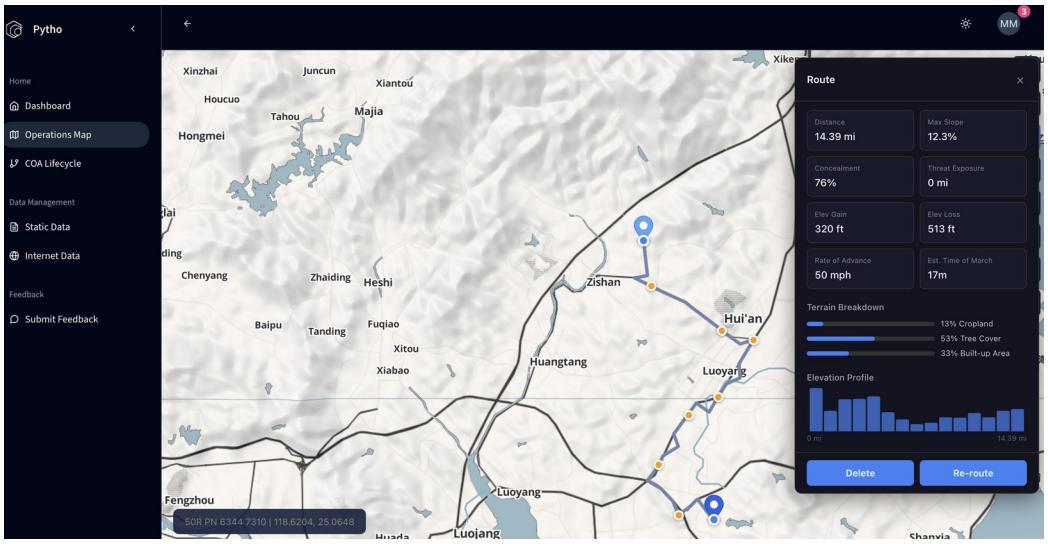

*Plan a Route — Select Route Tool*

*Choose Path Type: On Road, Off Road, or Mixed*

*Enter Route Preferences — Threat Avoidance, Slope, Concealment*

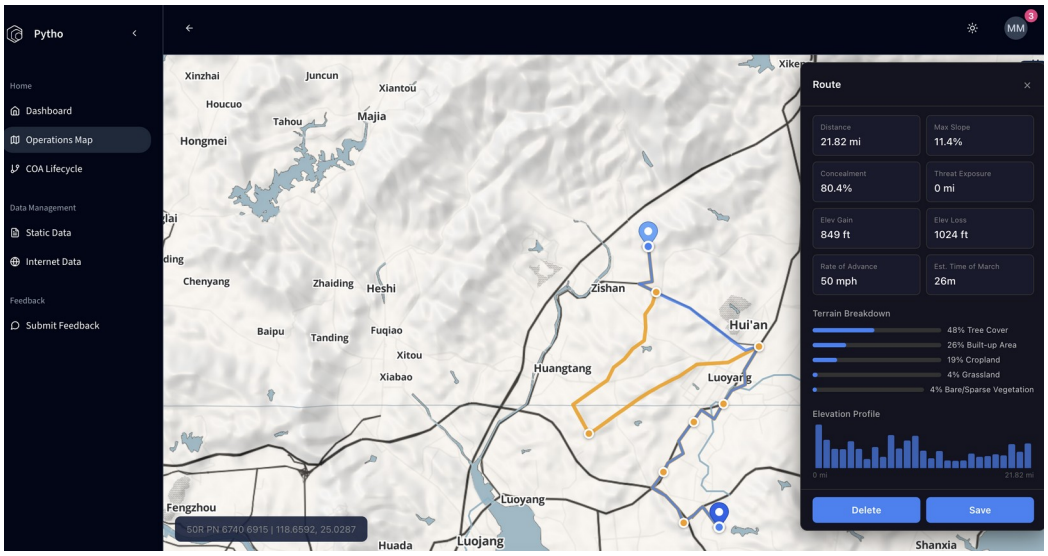

*View Recommended Route with Analysis Metrics*

## 11.7 Interactive Route Editing

Planning rarely follows a straight line. Intuitive route editing lets users manually refine routes while preserving continuous analysis and realism.

- Click any route to enter edit mode
- Control-point handles appear at equal distance intervals along the route
- Drag handles to reshape the route with smooth deformation
- An amber preview line overlays the original route to show proposed changes
- Analysis updates live as edits are made
- Save persists the updated route; Cancel restores the original

*Interactive Route Editing with Live Analysis Updates*

# 12. AI-Powered Hotwashes & Lessons Learned

## Becoming a Learning Organization

The Department of Defense and the Marine Corps must be learning organizations. In an era of rapid technological change, evolving adversary tactics, and Multi-Domain Operations, the force that learns fastest wins. Every exercise, every wargame, every operation is a data-rich opportunity to refine doctrine, update TTPs, improve training, and sharpen decision-making for the next fight. A learning organization is one that systematically captures observations, rigorously examines them, translates them into insight, and then propagates those insights across the enterprise so that the same mistakes are not made twice and the same successes can be replicated.

Lessons learned are the connective tissue between experience and future readiness. Done well, they close the loop between what happened, why it happened, and what must change. They ensure that the cost paid in one exercise—in time, effort, and hard-won insight—pays dividends across the force for years to come. “Ready to fight tonight” is not just about having the right equipment and the right manning; it is about having a force that has already learned the lessons that would otherwise have to be re-learned under fire.

## The Historical Problem with Lessons Learned

Despite decades of investment, the lessons learned enterprise has historically failed to deliver on its promise. The issues are well documented:

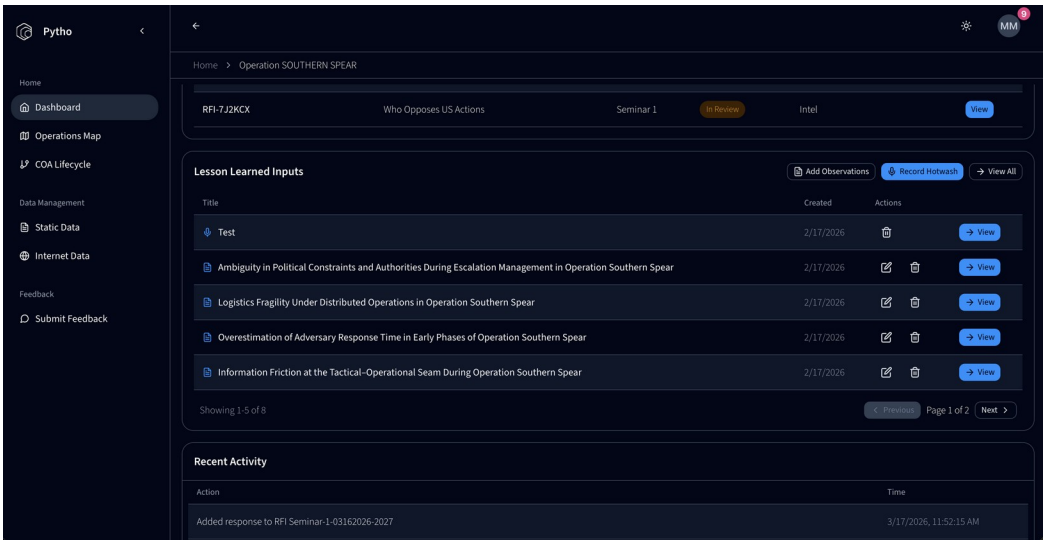

- **Observations are lost.** The most valuable insights from a wargame or exercise are captured informally in notebooks, whiteboards, and side conversations during hotwashes. Most never make it into any system of record. By the time the exercise is over, the best observations are gone.
- **Reports are written, then shelved.** When lessons learned reports are produced, they are often lengthy, static documents written weeks or months after the event. By the time they are circulated, the organization has moved on and the findings gather dust.
- **No one can find them.** Lessons learned repositories exist across the Services, but the content is fragmented, poorly tagged, and difficult to search. Planners working on the next exercise rarely have the time to dig through past reports to find what is relevant to their scenario.
- **They do not inform doctrine.** The path from a tactical observation at an exercise to a doctrinal change is long, opaque, and uncertain. Insights from the field rarely influence the publications, TTPs, and training products that shape the next fight.
- **They do not inform the next wargame.** Exercise planners building next year’s wargame seldom have an efficient way to pull lessons from last year’s wargame, let alone from adjacent wargames conducted by sister units or other Services. The institutional memory resets with every planning cycle.

- **They do not inform operational workflows.** Observations that could improve how units plan, coordinate, and execute in real operations rarely bridge the gap from the exercise environment to standard operating procedures in the field.

The result is an enterprise that pays the cost of learning without realizing the benefit. The War Room is designed to break this cycle.

## How The War Room Closes the Loop

The War Room provides an end-to-end AI-powered Lessons Learned capability that captures observations throughout an event, records and transcribes hotwashes, and generates insight at the speed of the exercise. Instead of waiting weeks or months for a report that may never be read, the White Cell, participants, and planners can surface findings in minutes and route them directly into the products, workflows, and doctrine that drive the next fight.

*Lessons Learned Dashboard — Observation Capture for Operation Southern Spear*

## 12.1 Continuous Observation Capture

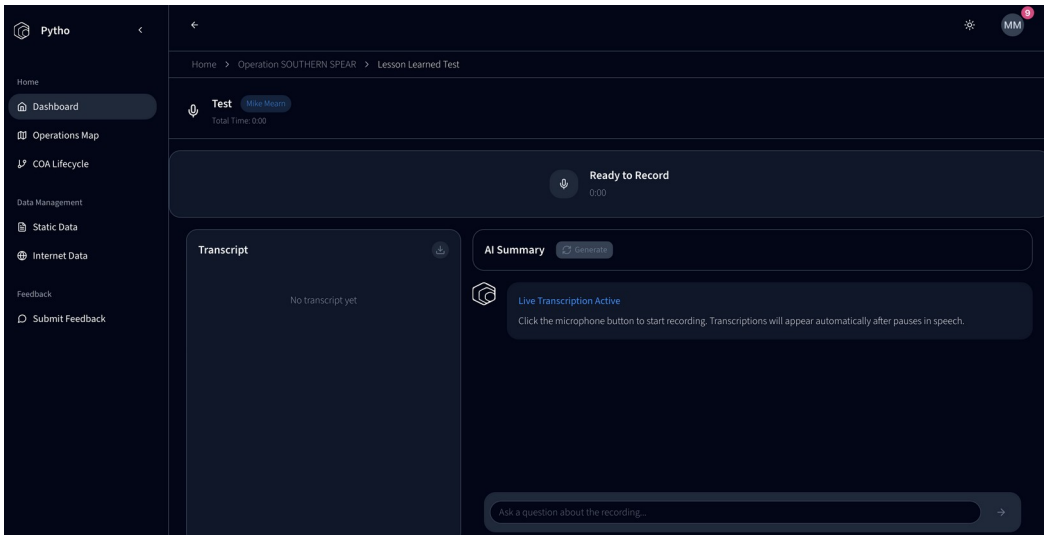

Observations should not wait for the hotwash. The War Room allows the White Cell, controllers, and participants to capture lessons learned inputs throughout the event as they unfold.

- Add observations at any point during the exercise—during play, between turns, or at the end of a seminar
- Tag observations to specific seminars, phases, decisions, or events for rich context
- Capture both positive findings (what worked and why) and negative findings (friction points, gaps, and failures)
- Build a running log of inputs that is always available for review, filtering, and analysis
- Every observation lives inside the event where it occurred, tied to the scenario, data sources, and products that framed the decision

## 12.2 Record & Transcribe Hotwashes

The hotwash is where the richest lessons surface—but traditionally most of it is lost to the ether. The War Room turns the hotwash into a first-class data source.

- One-click recording of the hotwash directly inside the event workspace
- Live transcription so facilitators and note-takers can focus on the conversation instead of typing
- AI-generated summary captures key themes, decisions, disagreements, and action items in real time
- Ask natural-language questions of the recording—for example, “What were the main friction points the J3 raised?”—and get grounded answers with citations back to the transcript
- The recording, transcript, and AI summary become permanent, searchable artifacts of the event

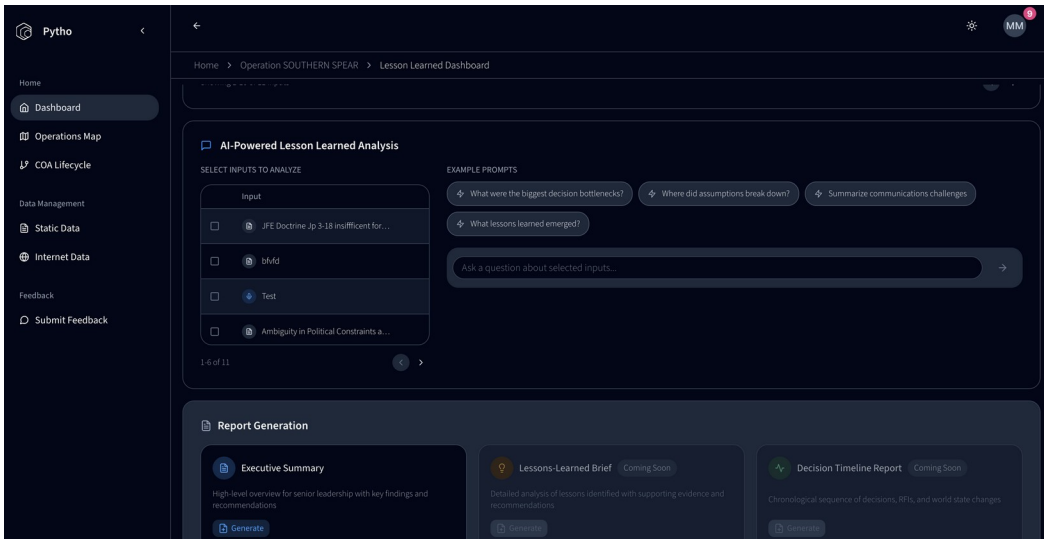

*Hotwash Recording — Live Transcription and AI Summary*

## 12.3 AI-Powered Lessons Learned Analysis

Capturing observations is necessary but not sufficient. The War Room turns raw inputs into insight. Planners can select any combination of observations, hotwash transcripts, doctrine, and supporting documents and run them through an AI-powered analysis workspace grounded in the event’s own data.

- Select the specific inputs to analyze—JFE Doctrine, SMEE notes, individual observations, or all of the above
- Use example prompts or ask your own questions in natural language
- Sample questions: “What were the biggest decision bottlenecks?”, “Where did assumptions break down?”, “Summarize communications challenges”, “What issues commonly emerged?”
- Every AI response is attributed to specific source inputs, so findings are verifiable and defensible

*AI-Powered Lessons Learned Analysis — Natural Language Interrogation of Observations*

### Report Generation

Once the analysis is complete, The War Room generates structured reports directly from the inputs and AI findings—no more weeks of manual writing.

- **Executive Summary:** High-level synopsis for senior leadership with key findings, decisions, and recommendations
- **Lessons Learned Brief:** Structured brief highlighting positive findings, friction points, and recommended changes suitable for dissemination across the enterprise
- **Decision Timeline Report:** Chronological account of key decisions made during the exercise with the rationale, data, and outcomes attached to each

## 12.4 Closing the Feedback Loop

The real value of lessons learned is in how they are used. The War Room is designed to feed insights back into the places where they shape future readiness:

- **Doctrine:** Surface patterns across multiple exercises that indicate where doctrine, TTPs, or publications need to be updated. Export findings directly into review-ready formats for the Service doctrine development process.
- **Existing Wargames:** Update the scenario, injects, and data sources of an in-progress wargame based on observations captured during play, so the exercise itself becomes more realistic and more challenging as it unfolds.
- **Future Wargames:** Seed next year's wargame with observations from this year's. Planners can search the full corpus of past events to ensure that known gaps are stressed, known successes are validated, and the next exercise builds on the last.
- **Adjacent Wargames:** Share lessons across units, Services, and combatant commands. A finding from a Division CPX can inform a MEU pre-deployment exercise, a Warfighter, or a Title 10 wargame, ensuring the joint force learns together.

- **Operational Workflows:** Translate observations into improvements to standard operating procedures, planning checklists, and unit battle rhythms so the lessons from the exercise environment actually change how the force operates in the field.

The result is an exercise enterprise that gets smarter with every event—where the same gap is not identified twice without action, and where every warfighter benefits from the hard-won insights of those who came before.

# 13. Multilingual Support for Joint & Allied Operations

No modern military operation is a single-nation fight. Every major campaign the United States has conducted in the past quarter-century has been executed alongside allies and coalition partners, and the trend is accelerating. Multi-Domain Operations, integrated deterrence, and campaigning in the Indo-Pacific, Europe, and beyond all rest on the same assumption: that American warfighters will plan, rehearse, and fight shoulder-to-shoulder with allies whose doctrine, tactics, and—critically—languages are not their own. Joint and allied interoperability is no longer a nice-to-have. It is a precondition for how the force expects to fight.

Wargaming is where that interoperability is first built and tested. If a coalition staff cannot plan together in a wargame, they will not fight together in a crisis. Language is one of the most persistent sources of friction in that process. Orders, intelligence products, injects, and after-action materials generated in English force allied participants to work in a second language—slowing decision-making, introducing translation errors, and quietly excluding partners from the full richness of the exercise. Conversely, products generated only in a partner's language create the same barrier in reverse for U.S. staffs. The result, across exercise after exercise, is that coalition wargaming operates at the pace of the slowest translator in the room.

## 13.1 The Capability

The War Room is built to remove that friction. Any wargaming product generated on the platform—OPORDs, FRAGOs, WARNOs, intelligence summaries, threat assessments, injects, hotwash summaries, lessons learned reports, and every custom product in the template library—can be translated directly from the document editor into any of the supported languages with a few clicks. Translation happens in place, on the finished product, in seconds. No export, no external tool, no third-party service, no data leaving the deployment.

A planner can generate an OPORD in English, translate it into French for a NATO partner and Japanese for a Pacific ally, and publish all three versions from the same event. Injects can be delivered to different seminars in the language of the role they are targeting. Hotwash summaries can be distributed to every coalition participant in the language they actually think in.

## 13.2 Supported Languages

The document editor currently supports translation into the following thirty languages:

| | | |
|---|---|---|
| Arabic | Greek | Portuguese |
| Chinese (Simplified) | Hebrew | Romanian |
| Chinese (Traditional) | Hindi | Russian |
| Czech | Hungarian | Spanish |
| Danish | Indonesian | Swahili |
| Dutch | Italian | Swedish |

| | | |
|---|---|---|
| English | Japanese | Thai |
| Finnish | Korean | Turkish |
| French | Norwegian | Ukrainian |
| German | Polish | Vietnamese |

*Do not see a language your coalition needs? Contact the Pytho team—we can add additional languages on request.*

## 13.3 Operational Impact

The benefits of native multilingual product generation show up across every phase of an exercise:

- **Faster coalition planning:** Partners are no longer waiting on human translators to keep up with a staff working in English. Every participant works from a product in their own language, in near real time.
- **More realistic information environments:** Injects reach participants in the languages they would encounter in the real world—adversary propaganda in the adversary's language, allied communications in the allied language, neutral media in the language of the region.
- **Wider lessons learned distribution:** A brief written once can be shared across a coalition without retyping. Findings reach every partner, in every language, at the same time.
- **Fuller partner participation:** Allies are treated as full participants in the exercise from the first minute, not as guests listening in on a conversation conducted in someone else's language.
- **Reduced translation error:** Products are translated consistently by the same platform that generated them, with the original English version preserved for reference at any time.

## 13.4 Availability on the Pilot System

Multilingual translation is fully available on the standalone Dell tower delivered to MCWL. Every product generated on the pilot hardware can be translated into any of the supported languages directly from the document editor, with no external network connectivity required and no data leaving the device. This capability can be exercised against any product the evaluator generates during the pilot.

# Appendix A: Your Hardware

This appendix describes the standalone hardware delivered to MCWL for the pilot and provides the operational detail needed to power it up, use it safely, and keep it running.

## A.1 What's in the Box

The War Room pilot kit consists of a single Dell tower workstation, pre-configured with The War Room application and all required dependencies, along with the standard peripherals needed to operate it.

| Item | Notes |
|---|---|
| Dell tower workstation | Pre-configured with The War Room application and local model stack |
| This user documentation | Printed copy and PDF on the workstation desktop |

*Hardware specifications: exact CPU, GPU, memory, and storage configuration are provided on the delivery paperwork accompanying the unit. Contact Pytho if you need a restated or signed specification sheet for property-accountability purposes.*

## A.2 Power On / Power Off

The system is designed to be operated like any other workstation. No special boot sequence is required.

1. **Power on:** Connect the power cable, monitor, keyboard, and mouse. Press the power button on the front of the tower. The system will boot to a locked login screen within approximately 60–90 seconds.
2. **Log in:** Use the pre-configured credentials provided in the delivery package. Credentials are for the standalone workstation account only and can be rotated following standard workstation procedures.
3. **Launch The War Room:** Open the web browser (Chrome) on the system. The application is pinned to the taskbar. If the browser does not display the application, contact the Pytho team (see Appendix C).
4. **Power off:** Close the browser, then use the operating system's Shut Down command. Do not hold the power button unless the system is unresponsive. The application services stop cleanly on shutdown.

## A.3 Where Your Data Lives

Everything The War Room does on this pilot system stays on this pilot system. Understanding where data lives is important for backup, transfer, and decommissioning.

- **Application and model files:** Installed under the standard program directory on the workstation's primary drive. These files do not change during normal use.

- **Event data:** All events, products, observations, hotwash recordings, transcripts, and generated artifacts are stored in the local event database on the primary drive. This is the data you will want to back up before major configuration changes.
- **Uploaded documents:** Static documents and reference materials uploaded into events are stored on the primary drive alongside the event database. They do not leave the device.
- **Logs:** Application logs are stored locally and are useful for troubleshooting. Contact Pytho for log locations if needed.

## A.4 Backing Up Your Work

Because this is a standalone pilot system, backups are the operator's responsibility. Pytho recommends a simple, periodic export to external media:

- Export generated products (OPORDs, injects, intel products, AARs) using the built-in download options to a USB drive after any significant exercise session
- Export hotwash recordings and transcripts periodically
- For a full event export (including the event database and associated artifacts), contact Pytho—an export script is available on request
- If the pilot transitions to a networked deployment, Pytho provides a clean migration path for all pilot data

## A.5 Restarting the Application

If the browser loses its connection to the application, or if the application appears to hang, a simple restart resolves the vast majority of issues:

1. Close the browser window.
2. Reopen Chrome. The application should auto-reload to the dashboard.
3. If the application still does not load, restart the workstation using the operating system's Restart command.
4. If problems persist after a full restart, contact the Pytho team (see Appendix C).

# Appendix B: Security & Data Handling

Security and data handling are foundational to any military software deployment. This appendix summarizes how The War Room handles data on the standalone pilot system and what evaluators should know about the system's security posture.

## B.1 Deployment Model

The pilot is delivered as a fully standalone, locally deployed system. It requires no external network connectivity to function. All of the platform's AI capabilities—product generation, geospatial reasoning, lessons learned analysis, hotwash transcription—run on the provided hardware using local models and local data.

- No external network connectivity is required to use the platform
- All models run locally on the provided hardware
- All user data, event data, and generated products remain on the device
- No telemetry, usage data, or user content is transmitted off the device
- The platform can be operated in an air-gapped environment

## B.2 Data Handling

Understanding where data flows (and where it does not) is essential for defense evaluators.

| Data | Where It Lives | Leaves the Device? |
|---|---|---|
| Uploaded reference documents | Local event storage | No |
| Generated products (OPORDs, injects, etc.) | Local event storage | No |
| AI responses and reasoning traces | Local event storage | No |
| Hotwash recordings and transcripts | Local event storage | No |
| Observation and lessons learned inputs | Local event storage | No |
| Model weights and application files | Local program storage | No |
| Application logs | Local log directory | No |

*Nothing a user does on this pilot system trains a shared or external model. User content is not used to improve models outside this deployment, and no content is transmitted off the device under normal operation.*

## B.3 Physical Security

Because the system is standalone and contains the full event database, physical security of the workstation is the primary security control. MCWL should handle the device in accordance with its

own standard procedures. Pytho is available to answer any platform-specific questions that come up during evaluation.

- If the unit needs to be decommissioned or returned, contact Pytho for a data-destruction checklist that covers the event database, uploaded materials, and application logs

## B.4 Access Control on the Pilot System

The pilot system is a single-user deployment by design, reflecting the White Cell perspective it was built to support. For the duration of the pilot, role-based access control, multi-user accounts, and distributed teaming are not enabled on this hardware; they are enabled in the networked production deployment described in Appendix E. If the pilot requires multiple operators, Pytho recommends sharing the workstation using standard shift-handover practices rather than attempting to reconfigure the system for multi-user operation.

# Appendix C: Support

For anything at all—questions, issues, feature requests, or feedback—reach out to the Pytho team and expect same-day assistance. We are here to support the warfighter and make an impact, and we will work rapidly to meet your needs.

| Channel | Contact |
|---|---|
| Email | mike@pytho.ai |
| Urgent / in-exercise support | Phone number provided in the delivery package |

# Appendix D: Glossary of Terms & Acronyms

The following glossary covers the military, technical, and product terminology used throughout this document. Terms are listed alphabetically.

| Term | Definition |
|---|---|
| AAR | After Action Review. Structured evaluation assessing objectives, outcomes, strengths, weaknesses, and lessons learned from an exercise or operation. |
| Agentic AI | AI systems built around autonomous agents that can reason, use tools, and take multi-step actions to achieve a goal, with humans in the loop for review and direction. |
| ASCOPE | Areas, Structures, Capabilities, Organizations, People, Events. Framework for analyzing the civil environment. |
| CCIR | Commander's Critical Information Requirement. Information the commander has identified as essential for decision-making. |
| COA | Course of Action. A scheme of maneuver, plan, or option under consideration by planners. |
| CONOPS | Concept of Operations. Describes how a commander visualizes the execution of an operation. |
| CPX | Command Post Exercise. A staff-level wargame conducted without maneuver of forces. |
| DoD | Department of Defense. |
| DXA | Document XML unit of measurement used by Microsoft Word (1440 DXA = 1 inch). Used internally by the platform's document export engine. |
| FRAGO | Fragmentary Order. Modifies or updates a previously issued order during execution. |
| HVTL | High-Value Target List. Prioritized list of adversary assets whose loss would significantly impair the enemy's plan. |
| IIR | Intelligence Information Report. Raw, unevaluated HUMINT reporting. |
| INTREP | Intelligence Report. Describes friendly and enemy intelligence situation at a point in time. |
| INTSUM | Intelligence Summary. Consolidates intelligence information over a reporting period. |
| IPOE / JIPOE | (Joint) Intelligence Preparation of the Operational Environment. The analytic process to understand the operational environment and adversary capabilities. |
| LLM | Large Language Model. A class of AI model trained on large corpora of text and used for reasoning, generation, and analysis. |
| LSE | Large Scale Exercise. A joint or service-wide training exercise. |
| MASINT | Measurement and Signature Intelligence. Intelligence derived from technical signatures—acoustic, seismic, thermal, radar, chemical. |

| | |
|---|---|
| MDMP | Military Decision-Making Process. The Army's structured planning methodology. |
| MEU | Marine Expeditionary Unit. |
| MIL-STD-2525D | Military Standard 2525D. DoD standard for joint military symbology used on maps and overlays. |
| NWPAC | Naval War College exercise series in the Pacific region. |
| OAKOC | Observation and fields of fire, Avenues of approach, Key terrain, Obstacles, Cover and concealment. Framework for terrain analysis. |
| OPORD | Operation Order. Complete mission execution guidance across all warfighting functions. |
| OPSUM | Operational Summary. Describes friendly operations over a reporting period. |
| PIR | Priority Intelligence Requirement. Intelligence required by the commander to make a critical decision. |
| PMESII | Political, Military, Economic, Social, Information, Infrastructure. Framework for analyzing operational variables. |
| RFI | Request for Information. A formal request for information that the requester does not currently have. |
| RIMPAC | Rim of the Pacific exercise. The world's largest international maritime warfare exercise. |
| SALUTE | Size, Activity, Location, Unit, Time, Equipment. Reporting format for spot reports. |
| SITEMP | Situation Template. Graphic depiction of assumed adversary dispositions and courses of action. |
| SMEE | Subject Matter Expert Exchange. A forum for exchanging knowledge between experts. |
| SOP | Standard Operating Procedure. |
| SPOTREP | Spot Report. Immediate tactical-level report of a significant event. |
| TTP | Tactics, Techniques, and Procedures. |
| WARNO | Warning Order. Preliminary notice of an order or action to follow, enabling parallel planning. |
| White Cell | The exercise control group responsible for managing wargame execution, delivering injects, adjudicating outcomes, and conducting assessments. |

# Appendix E: Scaling Path — Beyond the Pilot

The standalone Dell tower delivered to MCWL is a pilot deployment—designed to let a single evaluator experience the full feature set of The War Room in a low-risk, low-friction environment. It is not the target-state deployment. This appendix describes how The War Room scales from this pilot to an enterprise-grade, networked, multi-user deployment that can support division-, Service-, and joint-level wargaming at scale.

## E.1 Where the Pilot Sits in the Capability Spectrum

The pilot configuration exercises the full feature set of the platform but within the constraints of a single user on a single machine. In practical terms:

- All core capabilities—AI product generation, COA lifecycle, Geospatial Engine, inject generation, hotwashes, lessons learned—are fully available
- All data stays on the device; nothing leaves the workstation
- A single user account operates from a White Cell perspective
- The primary goal is to validate feature fit, workflow fit, and overall utility to MCWL evaluators

## E.2 The Networked Deployment

Once the pilot proves feature and workflow fit, The War Room is designed to scale into a networked deployment that supports the actual use cases MCWL and its partners need to run. This includes:

- **Multi-user operation:** Multiple concurrent user accounts for planners, White Cell members, participants, intelligence analysts, and command staff—each with role-based access.
- **Role-based access control:** Fine-grained permissions controlling who can view, edit, and share events, products, and data sources. Supports personas from Division Planner to White Cell controller to participant.
- **Shared workspaces:** Events, products, and observations shared across teams and units, with full collaboration features (comments, tagging, notifications, Personal and Shared spaces).
- **Cross-event search:** Planners can search across the full corpus of past exercises, products, and lessons learned—bridging institutional memory between wargames.
- **Centralized data and model management:** System-level doctrine, templates, and reference data curated centrally and made available across all events.
- **Scale to the exercise:** Infrastructure sized appropriately for the expected user and event load, from a single-unit deployment up to a Service- or combatant command–wide deployment.

## E.3 Integration with Existing Systems

A scaled deployment is most valuable when it connects to the systems warfighters already use. The War Room is designed to integrate into existing command, control, and knowledge management environments rather than replace them.

- **Document and knowledge systems:** Ingest doctrine, publications, intelligence products, and mission data from existing document management and knowledge management environments.
- **Planning and briefing tools:** Export products in formats compatible with existing briefing workflows, with direct integration planned for the most commonly used tools.
- **Geospatial systems:** Geospatial outputs designed to be compatible with existing tactical mapping environments.
- **Identity and access:** Integration with enterprise identity providers for single sign-on and consistent role-based access across the force.
- **Data pipelines:** The platform is built to accept multimodal, unstructured data from disparate sources—open standards mean new integrations do not require bespoke data formats.

*Pytho is prepared to support MCWL through every step of the scaling journey. The pilot is the first step—the platform is built for what comes next.*

# Appendix F: Quick Reference Card

A single-page field reference for operators. Tear this page out of the printed copy and keep it next to the workstation.

## Core Workflow

| Step | What to Do |
|---|---|
| 1. Create Event | Events → New Event. Name the exercise, add description, choose scenario context. |
| 2. Configure Data | Event Settings → Data Sources. Toggle doctrine, publications, and reference materials. |
| 3. Generate Products | Operational Workspace. Ask the AI for OPORDs, intel products, injects, or custom products. |
| 4. Build Map | Geospatial Engine → natural language commands for units, overlays, routes. |
| 5. Develop COAs | COA Lifecycle → Setup → Development → Wargame → Comparison → Approval. |
| 6. Deliver Injects | Injects panel. Schedule AI-generated or manually created injects to seminars. |
| 7. Run Hotwash | Lessons Learned → Record Hotwash. Live transcription and AI summary. |
| 8. Analyze & Report | Lessons Learned → Select inputs → Ask questions → Generate reports. |

## Key Capabilities at a Glance

| Capability | Where to Find It |
|---|---|
| AI product generation | Operational Workspace → Generate Product |
| Custom product templates | Products → Create Your Own |
| Pre-built product library | Products → Browse Templates |
| RFI management | Operational Workspace → Submit RFI |
| COA lifecycle | COA Lifecycle nav link |
| Geospatial engine | Operations Map nav link |
| Inject generation | Event → Injects panel |
| Hotwash recording | Event → Lessons Learned → Record |
| Lessons learned analysis | Event → Lessons Learned → Analyze |
| Collaboration (Shared Space) | Event → Shared Space |

## If Something Goes Wrong

| Symptom | First Step |
|---|---|

| | |
|---|---|
| App won’t load | Refresh the browser. If still broken, restart Chrome. |
| Still broken after browser restart | Restart the workstation. |
| Generation fails | Cancel, refresh, retry with additional mission context. |
| Map won’t render | Zoom out, then zoom back in. |
| Hotwash won’t record | Grant microphone permission to Chrome. |
| Anything worse than that | Email mike@pytho.ai with a screenshot and the approximate time the issue began. |

## Support

| Type | Contact |
|---|---|
| Primary support | mike@pytho.ai |
| Urgent / in-exercise support | Phone number in the delivery package |
| Feature requests and feedback | mike@pytho.ai |

# Appendix G: Contact & Support

For any questions, comments, and feedback, please reach out to the Pytho team. We will respond quickly and build accordingly.

*HARDWARE NOTE: This standalone Dell tower deployment supports a single user account operating from a White Cell perspective. For full application functionality including concurrent multi-user access, role-based permissions, and distributed teaming, the platform must be scaled to a networked deployment. Contact Pytho for technical specifications and scaling requirements.*
