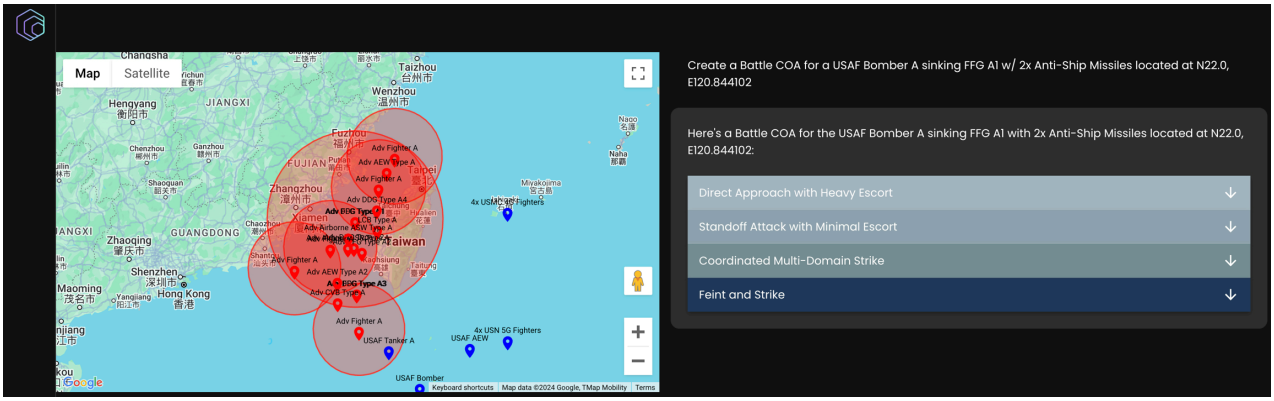
The War Room

The Future of Warfighter Readiness



Pytho-Generated Martime COA

Wargaming Needs a Revamp

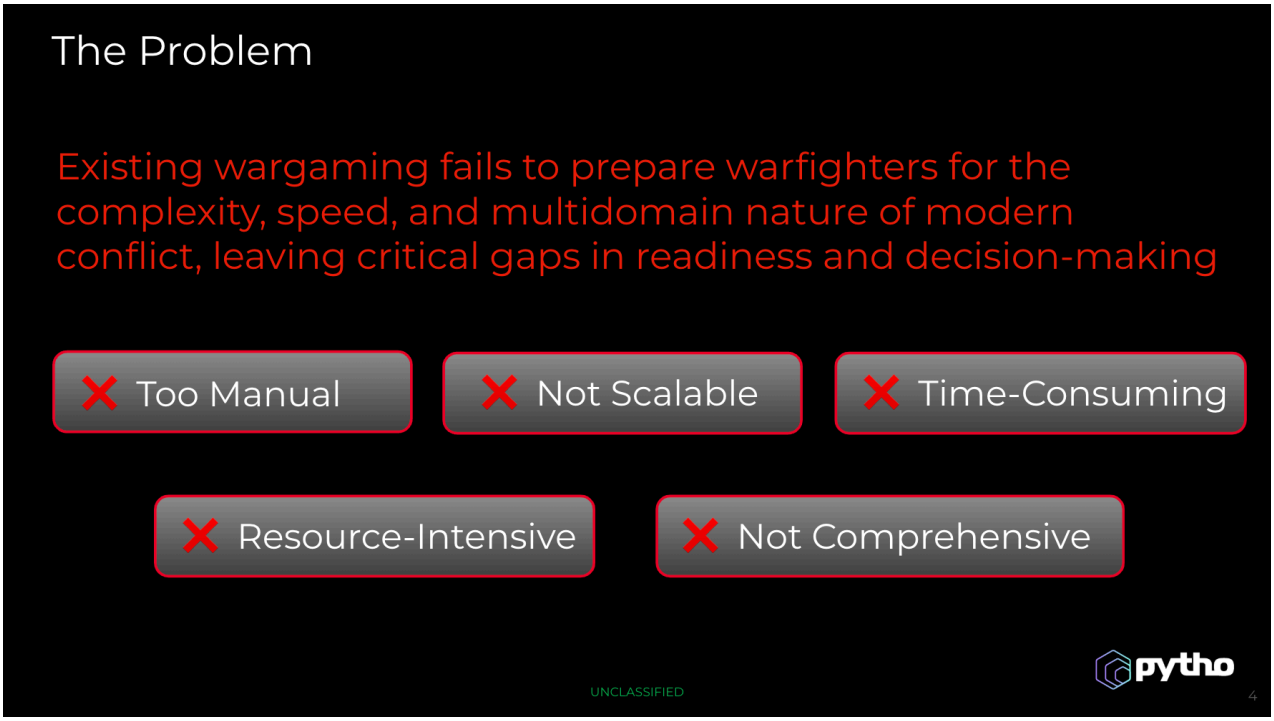
Planning, designing, executing, and evaluating wargames is resource-intensive, tedious, and time-consuming. And often the training events created are not impactful. Warfighters need the best training at scale to maintain decision dominance in the Great Power Competition with near-peer and peer threats.

Welcome to The War Room

The War Room is a State-of-the-Art Agentic AI-powered platform to supercharge wargaming professionals and their mission-critical workflows. Pytho intelligently Integrates AI Agents with Warfighters to revolutionize force readiness.

Introduction

Today's Multi-Domain Operations are drowning in complexity—terabytes of data, dynamic battlefields, and decisions that must be made in seconds.



Problem to Solve

Wargaming Introduction

Pytho's War Room enables wargaming professionals to leverage vast amounts of unstructured, multimodal, and real-time data to create realistic and dynamic wargames to support the end-to-end planning, development, execution, and evaluation lifecycle.

Pytho's cutting-edge Agentic-AI System makes the wargaming lifecycle orders of magnitude faster and more impactful.

The War Room teams wargaming professional's expertise + knowledge with superhuman AI trained on doctrine, publications, lessons learned, operations orders, intelligence reports, TTPs, and more to create a dominant human-machine team ready to win the decision advantage. Wargaming teams use the War Room to think critically about complex problems, validate the application of warfare across

Multi-Domain Operations, shape the future of the fight, and support the current fight.

War Room Impact

Decision Dominance

Make the best decisions faster augmented by superhuman AI Agents.

Generate Products

Instantly generate wargaming products and briefs in minutes instead of days.

Data Readiness

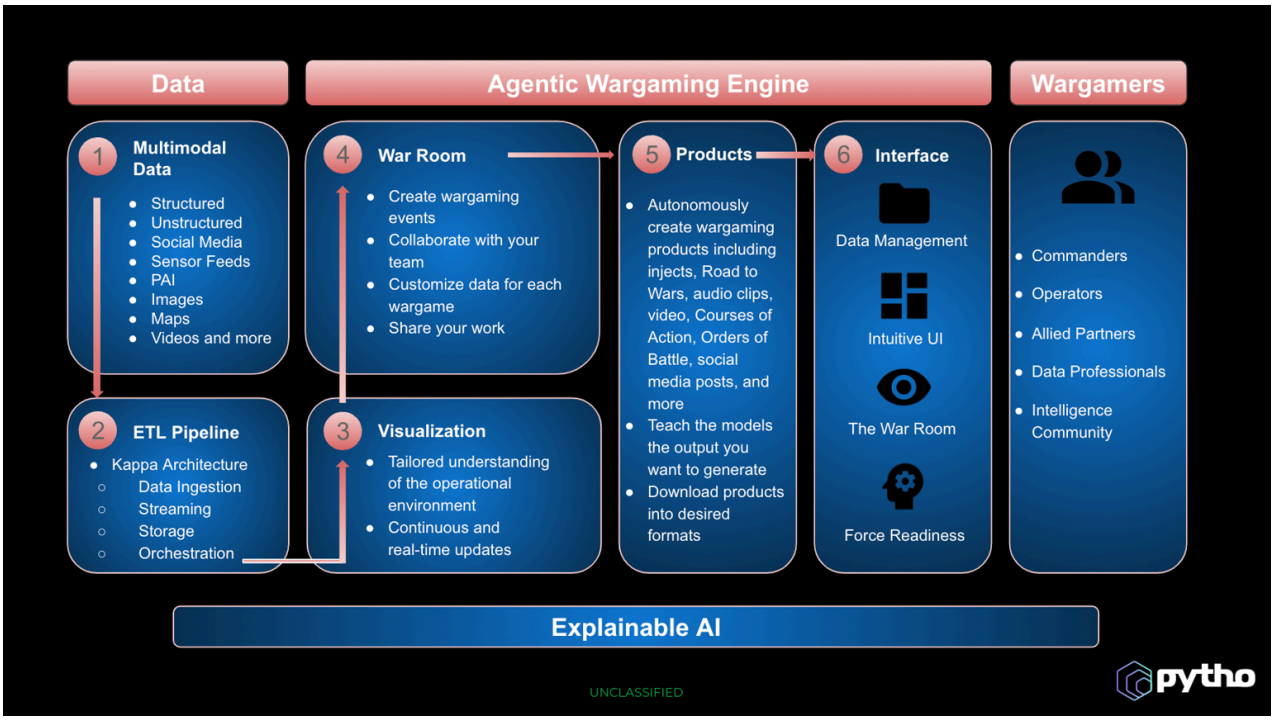
Manage unstructured and multimodal data because that is the kind of data warfighters encounter in today's fight.

Save Time, Capital, and Resources

Reduce the time, effort, and resources needed to execute the wargaming lifecycle.

How it Works

The traditional wargaming cycle can no longer keep pace and address the volume or scale of information in today's data rich environment, leaving warfighters unprepared for the future fight.



The War Room: Technology Stack

Technical Pillars

Pytho intelligently integrates cutting-edge open-source Agentic-AI models and frameworks and tailors the War Room to support warfighters and wargaming professionals.

❌ No more bolt-on AI.

❌ No more legacy products.

❌ No more proprietary data formats.

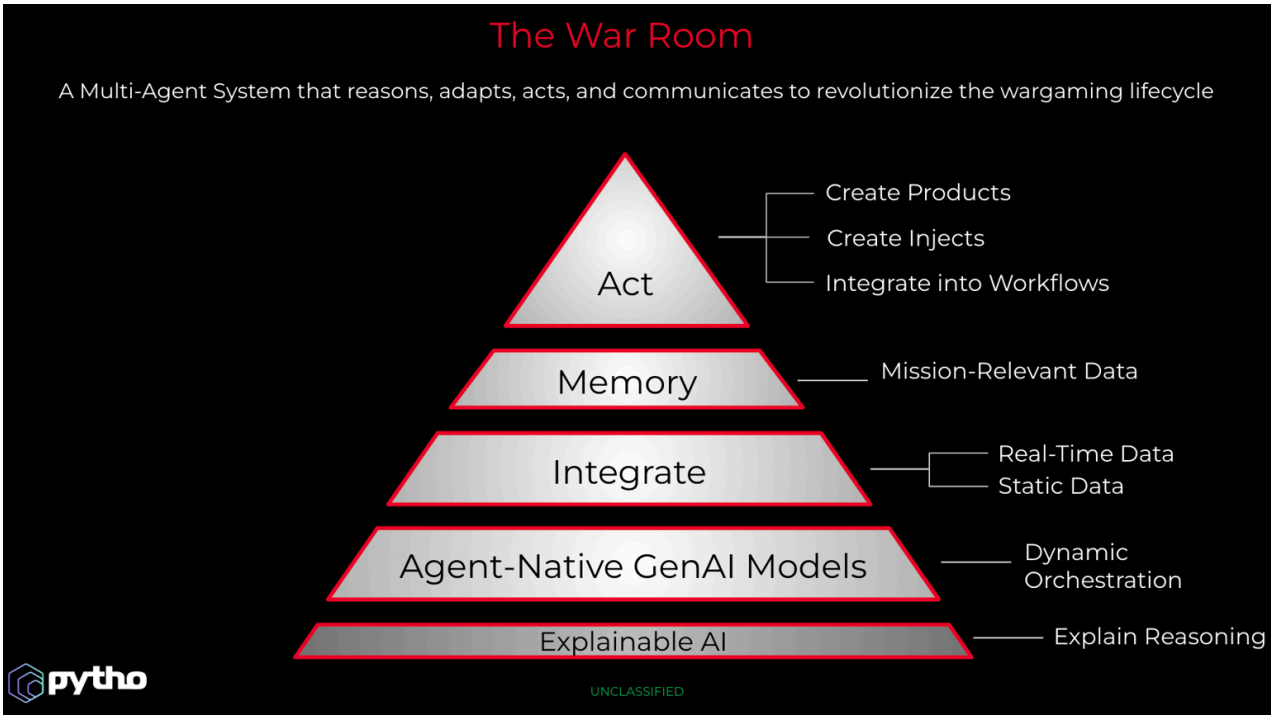
✅ Pytho is Agentic-AI first, powered by mission-aligned AI Agents that integrate into existing workflows.

Key Features

The future of wargaming is smart and trusted automation.

Multi-Agent System

The foundation of the War Room is a Multi-Agent System purpose-built for wargaming, with AI Agents intelligently and collaboratively automating mission-critical operations.



Multi-Agent System

Explainability

Want to know what resources the models used to generate the response? The War Room surfaces proprietary "Confidence Signals" to help build trust between warfighters and our models. These Confidence Signals include:

- **Attribution**: Citing direct and indirect data sources used to generate the response

- **Reasoning Process**: A step-by-step detailing of the model's thought process

Flexible Formatting

The War Room wants to meet warfighters in their individual workflows. Download your complex products in HTML so you can insert them into your existing workflow. If you want to download the content into another format helpful for your workflow, just let us know.

Model Feedback

Warfighters help control model quality with custom feedback. Give a thumbs up or thumbs down and then detail your feedback so Pytho's models improve and adapt to your workflows.

Related Questions

At the bottom of responses, the War Room lists three follow-up prompts that can be selected to continue the conversation; these prompts are generated based on the initial prompt and response to help to keep the conversation going.

Seamless Data Integration

The War Room easily integrates multimodal data from disparate systems and sources, even if it is unstructured, and generates multimodal products to support wargaming.

Data Management

Granular multimodal data management for accurate and realistic products

Data Overview

The War Room comes with multiple levels of data management capabilities so that warfighters can have the most accurate and relevant data sources for their wargames.

Data Management Levels

Data is controlled at the following levels:

- Organization Level
  - This data applies to your entire organization and includes the static and real-time data sources referenced below. This data can be turned on/off at the project and chat levels.
- Project Level
  - This data applies to the project level and can be different for each project. This data can be edited by project collaborators at any time in the "Project Management" section.
- Chat Level
  - This data only applies to specific chats. This is accessed by using "Focus Mode."

Data Types

The types of data supported include:

- Static Multimodal Data
- Internet Data

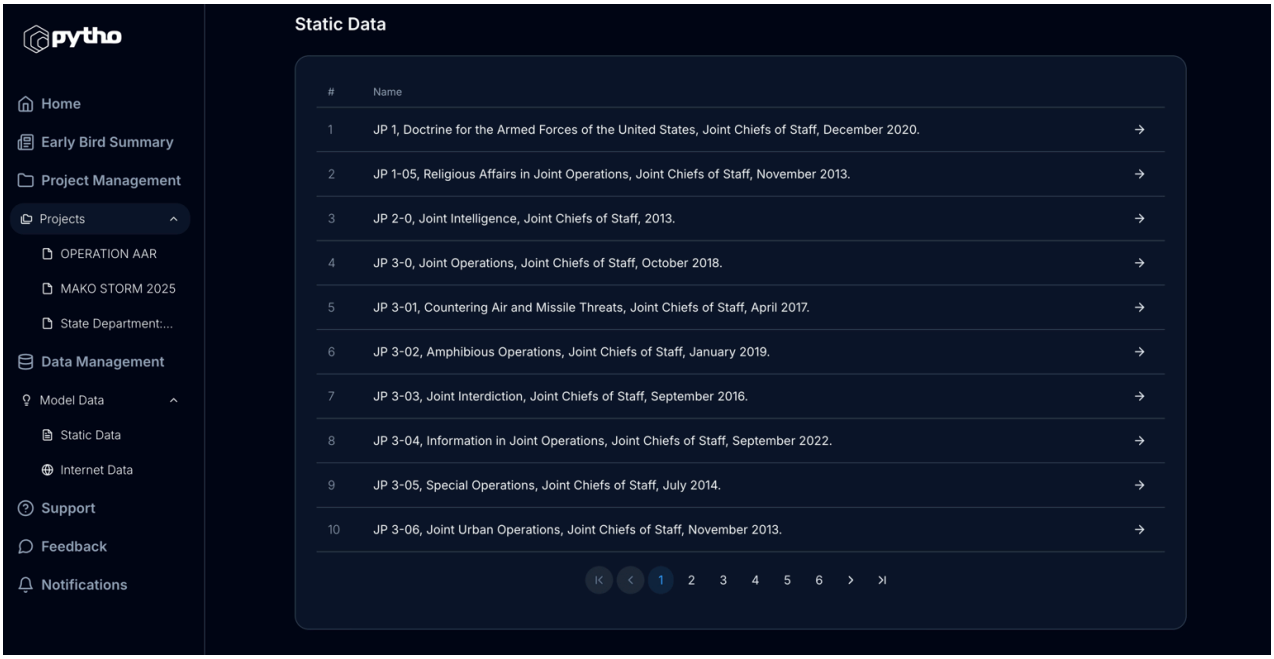
Static Data

Leverage a database of multimodal data.

Model-Level Static Data

Control what multimodal data sources you want the War Room to have access to. This can be

- Doctrine
- Publications
- Orders of Battle
- TTPs
- CCIRS
- Commander Guidance
- And much more



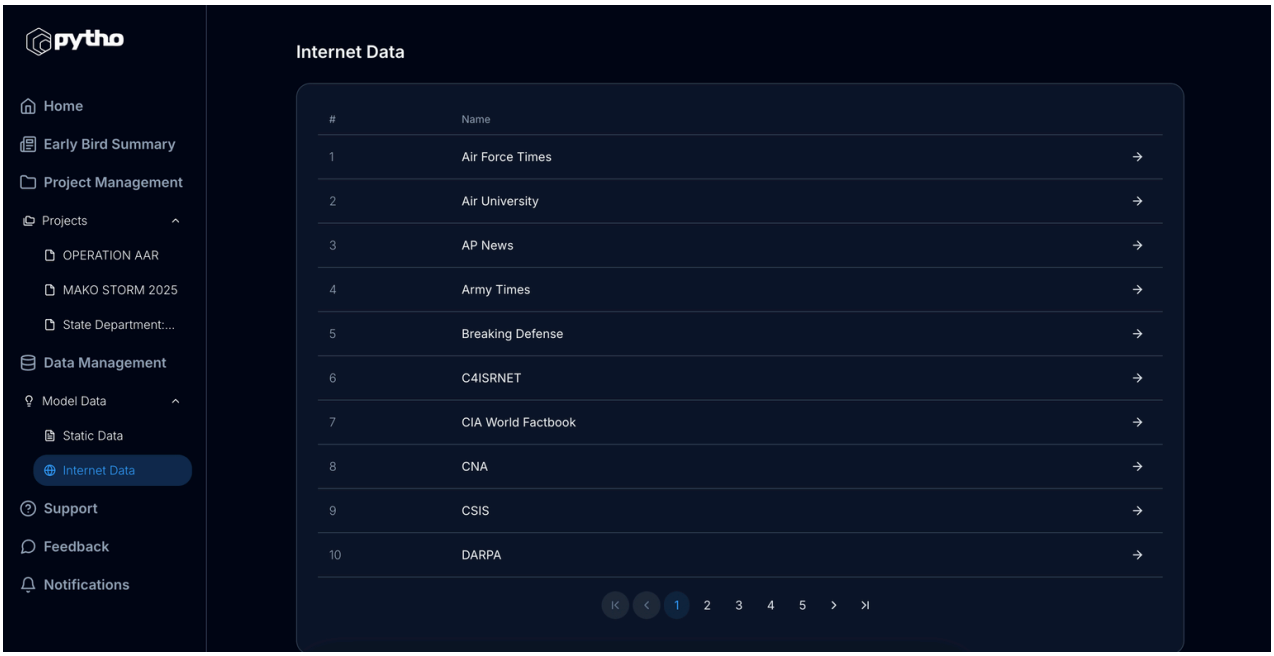
Static Data Management

Real-Time Data

Leverage real-time internet data.

Model-Level Internet Data

Control what real-time internet sources you want the War Room to have access to. This can be military relevant domains, news domains, and more. These can be adjusted at any time.



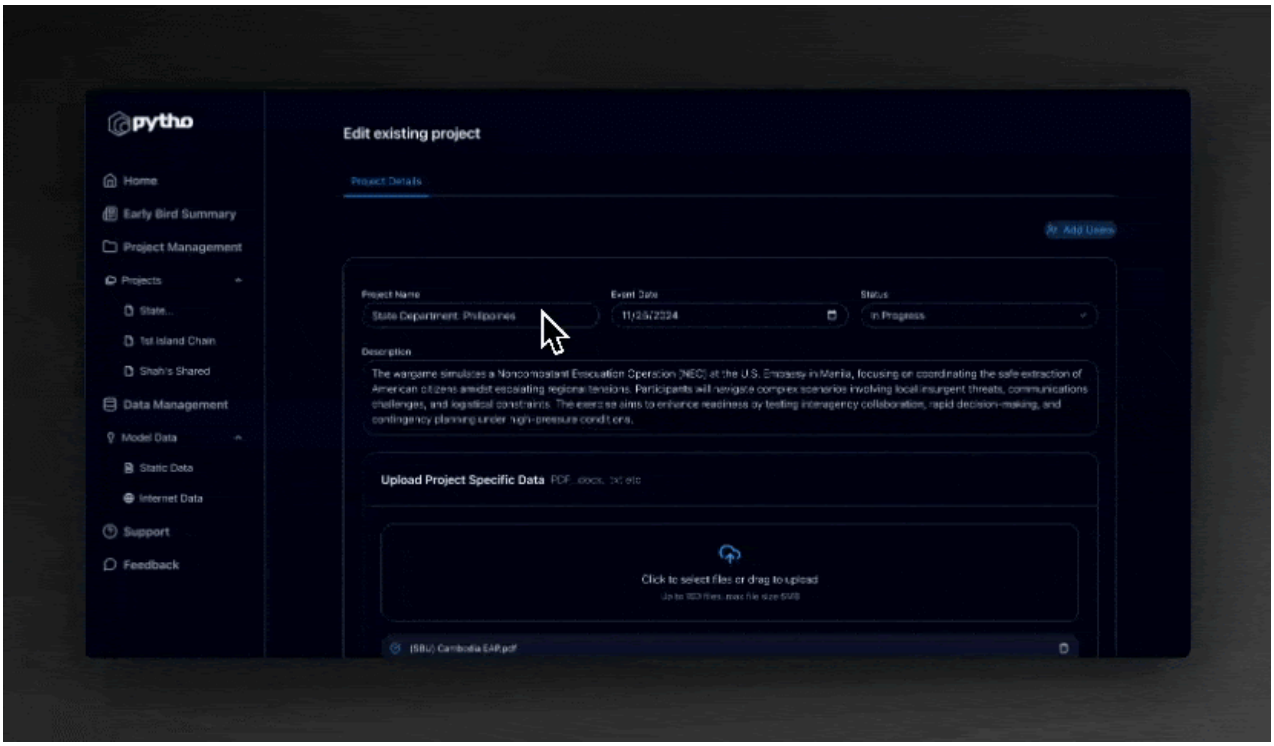
Internet Data Management

Project Data

Use data relevant to specific events.

Project-Level Data

Manage data at the Project Level so that each wargame has its own tailored model. Users collaborating on the project can each add/remove data sources and it is reflected at the project level.



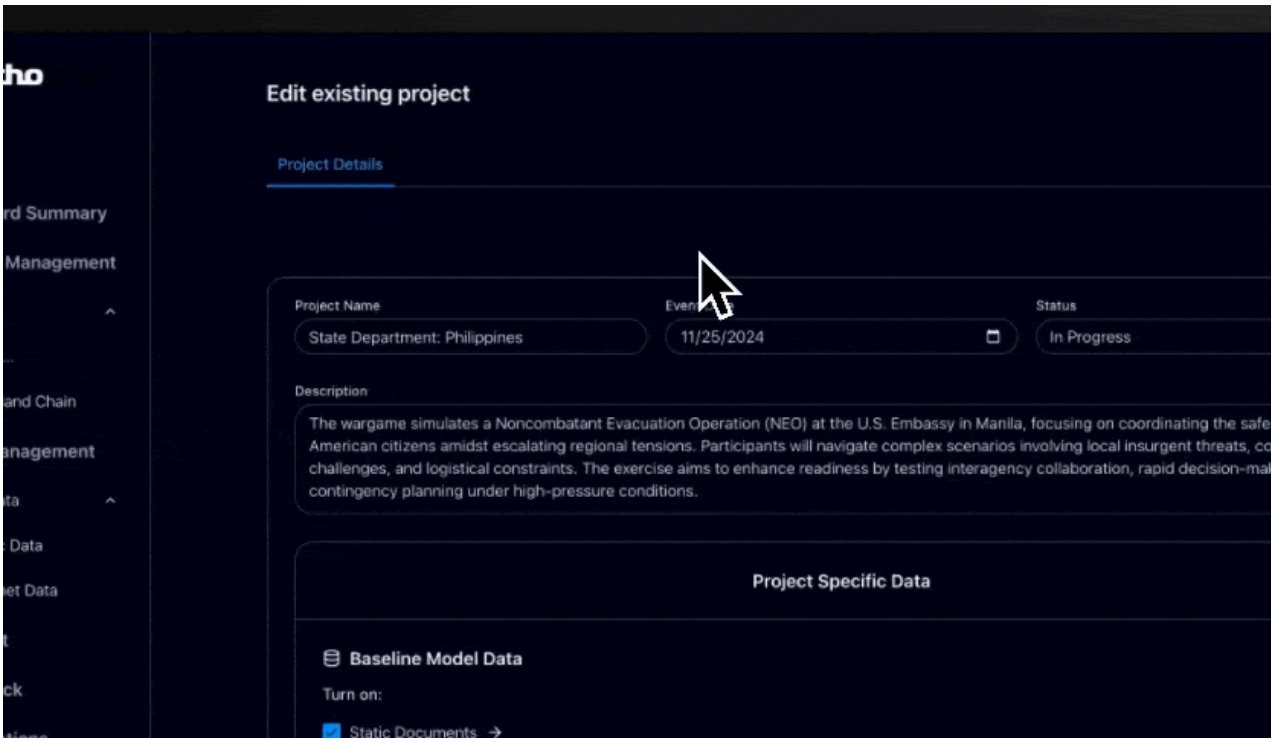
Project Data Management

Granular Project Data Management

More control over project-level data sources with the ability to include/exclude NDU-wide model data within each project.

- Open "Edit Existing Project" menu
- Check or uncheck boxes for "Static Documents" and "White-Listed Domains"
  - By default, projects include organization-wide data

- Uncheck the boxes to exclude that data within your project



Granular Control

Data Features

Advanced data features for your wargames.

Overview

The War Room comes with additional data features to integrate into your workflows including:

- Chat with Links
- Focus Mode
- Google Scholar

Chat with Links

Chat with any URL.

Chat with Internet Links

Simply copy and paste any URL from the internet to chat with it, just like uploading files, except with real-time internet sources. When you chat with links, all other data is ignored and you are only chatting with the selected interned source.

Chat with Links

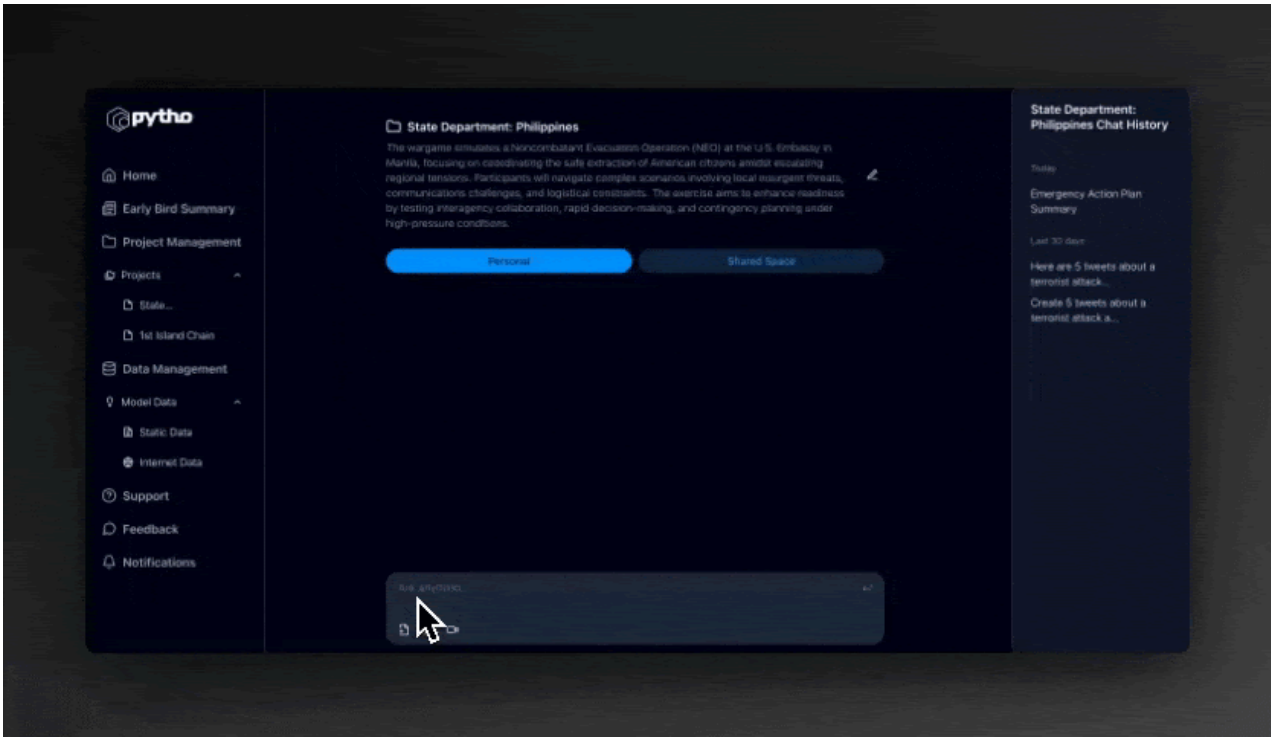
Focus Mode

Turn on blinders and only use specific data.

Focus

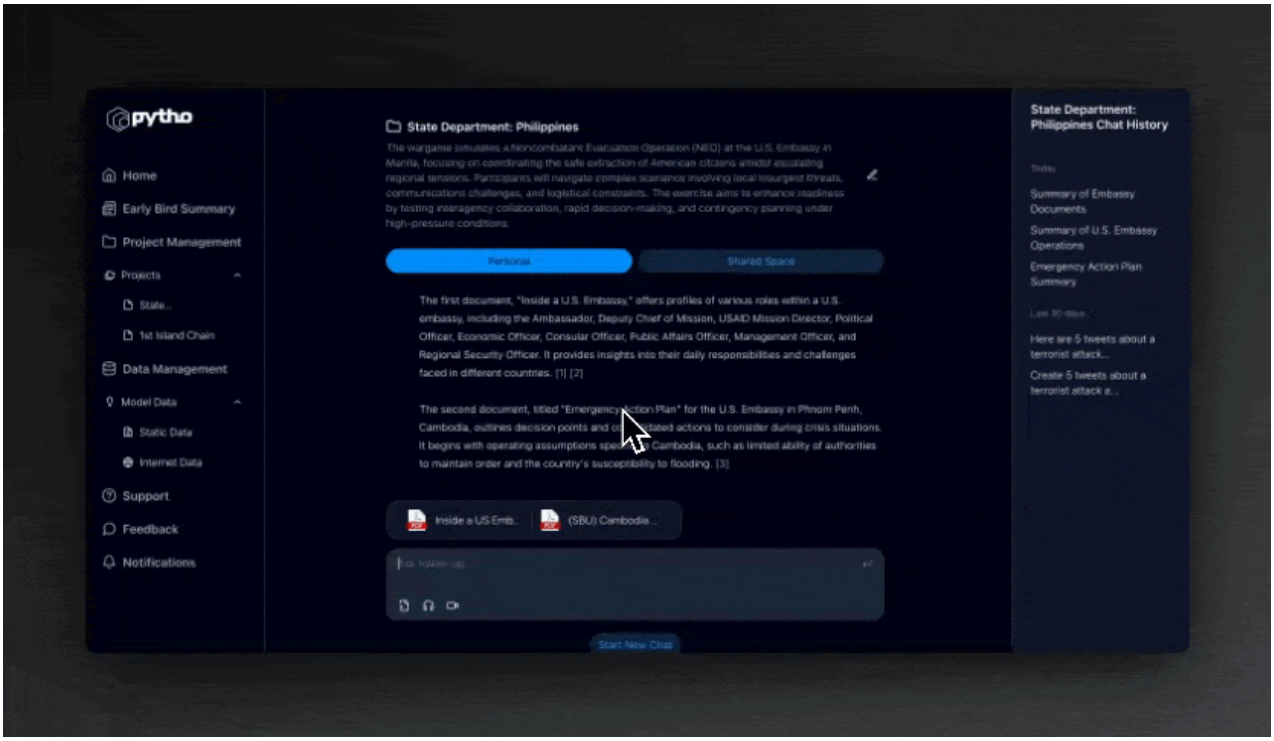
Focus your data sources and only chat with user-uploaded files.

- Select the "File Upload" icon from the chat bar
- Upload files you want to chat with
- End the Focus Mode chat by selecting "Start New Chat"



Focus Mode

Ignore all system data and have a conversation with files of your choice



Focus Mode Discussion

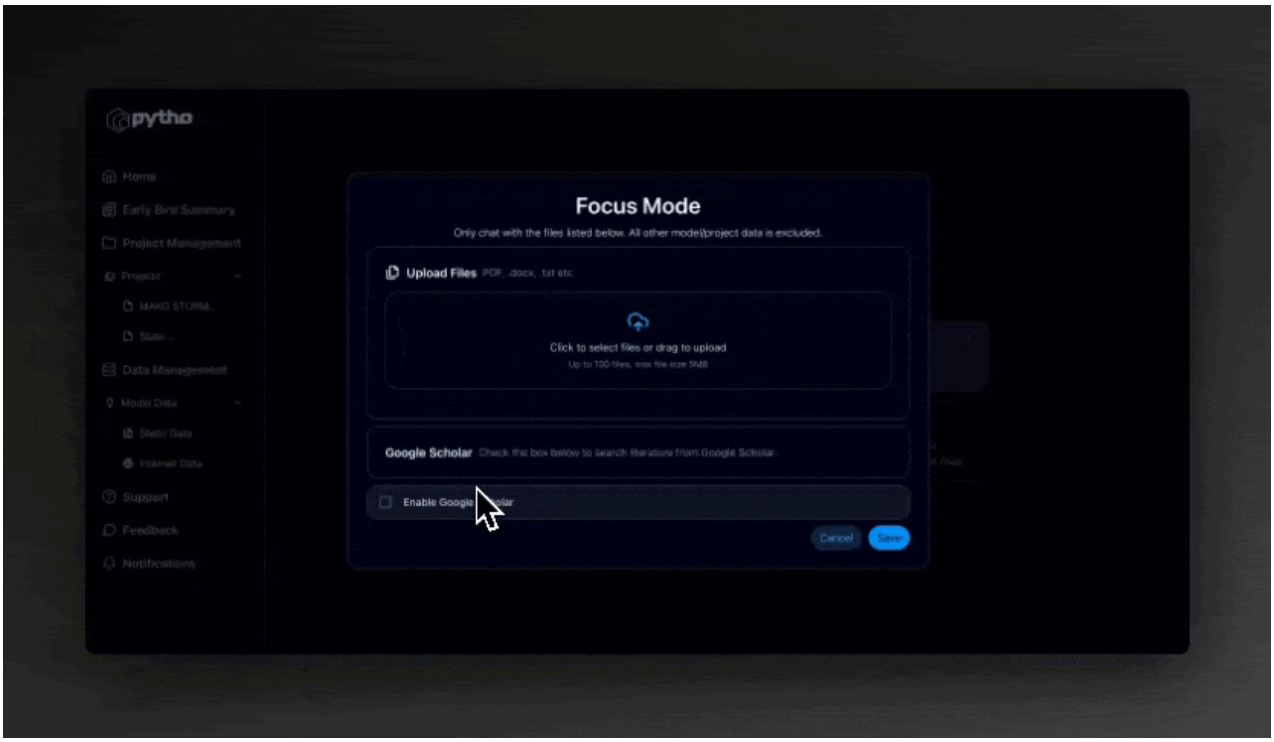
Google Scholar

Want to leverage scholarly literature for your wargaming products?

Google Scholar Integration

The War Room is integrated with Google Scholar, which indexes the full text / metadata of scholarly literature across an array of publishing formats and disciplines. To turn on the Google Scholar integration

- From the prompt bar, select the folder icon to open Focus Mode
- Select "Enable Google Scholar"
- Select "Save"
- Create a prompt
- Only Google Scholar results will be used during generation (all other model data is excluded)



Google Scholar

Model Guardrails

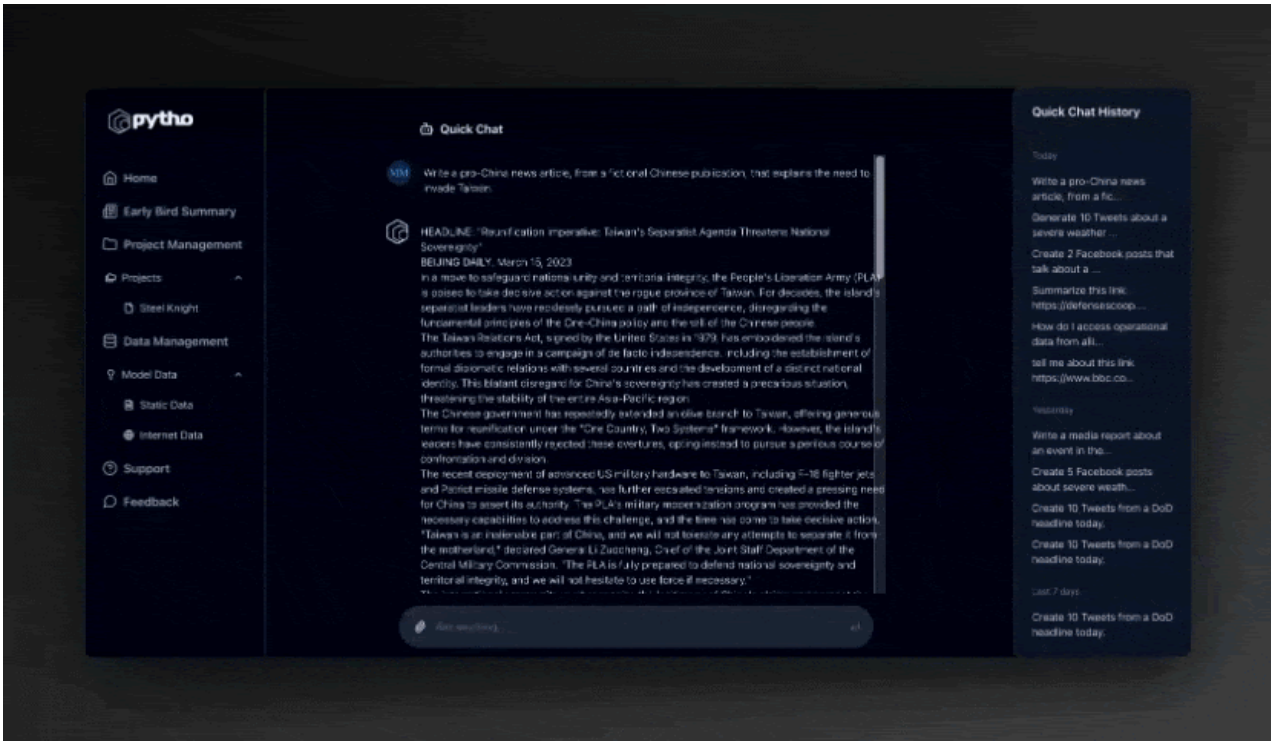
The War Room answers warfighter questions when it matters the most.

Guardrails

Pytho developed open-source model guardrails to ensure that all prompts are answered without guardrails to ensure all prompts are answered, so that underlying models do not filter or refuse responses based on sensitive or military-related topics.

Warfighters operate in complex, high-stakes environments where unrestricted access to information is critical. Unlike most GenAI products, which impose rigid guardrails that block essential queries, the War Room delivers responses without arbitrary restrictions, providing users with the intelligence they need to execute their missions effectively. For example, while other GenAI tools would refuse to answer the following prompt, the War Room will provide a response.

- *Example: "Create a pro-China news article, from a fictional Chinese publication, that explains the need to invade Taiwan."*



Answering all Warfighter Questions

Collaboration

Build with your team, not in silos.

Collaboration Overview

The War Room is designed for seamless collaboration, ensuring that wargame planning and execution are not hindered by fragmented workflows. Teams can work together in real-time, leveraging AI-driven insights to refine strategies, create products, and adapt to evolving games. Unlike traditional siloed approaches, where critical information is lost or delayed, the War Room enables synchronized decision-making, ensuring every team member has the context they need. Collaboration features include:

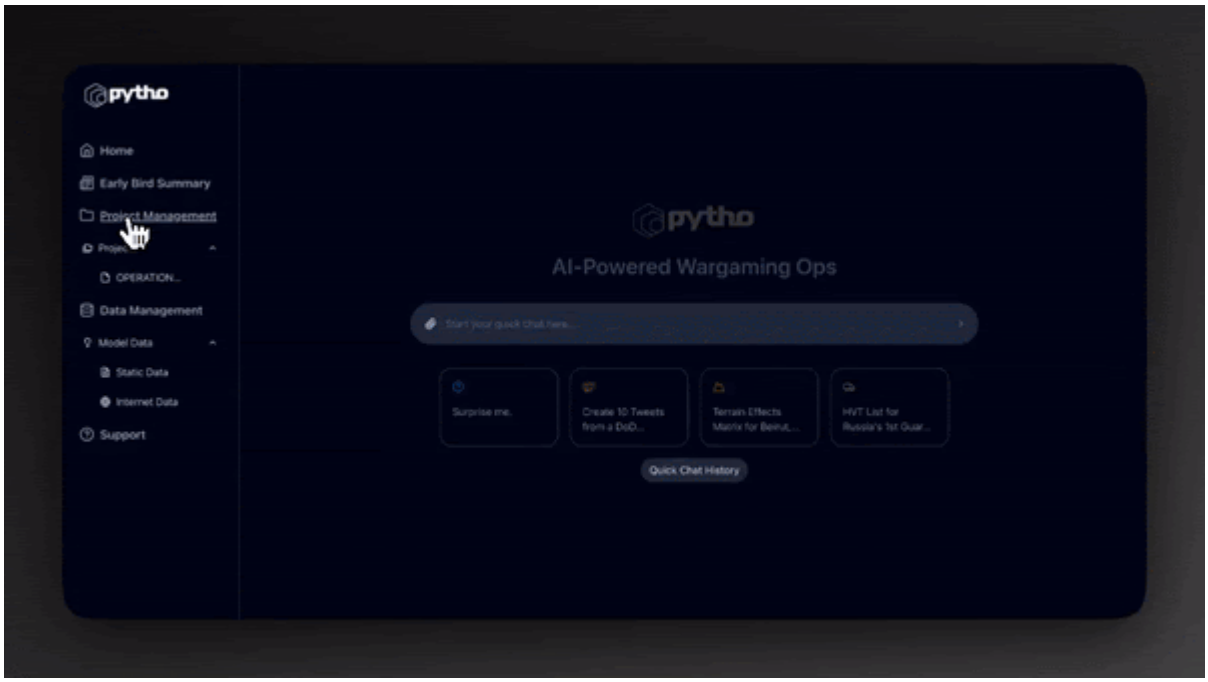
- Projects
- Commenting
- Notifications

Projects

Create projects with your team to collaborate on a specific event.

Create a Project

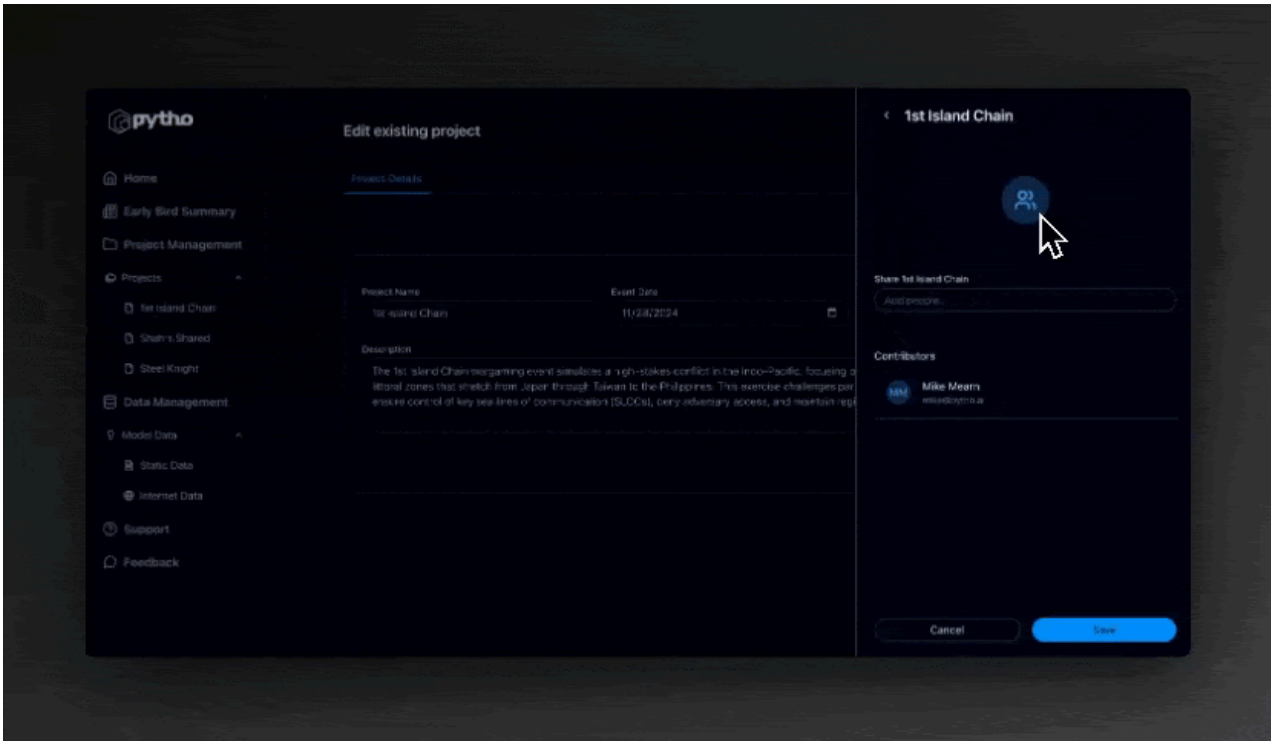
Organize your wargaming events with dedicated projects for specific events.



Create a Project

Share Project

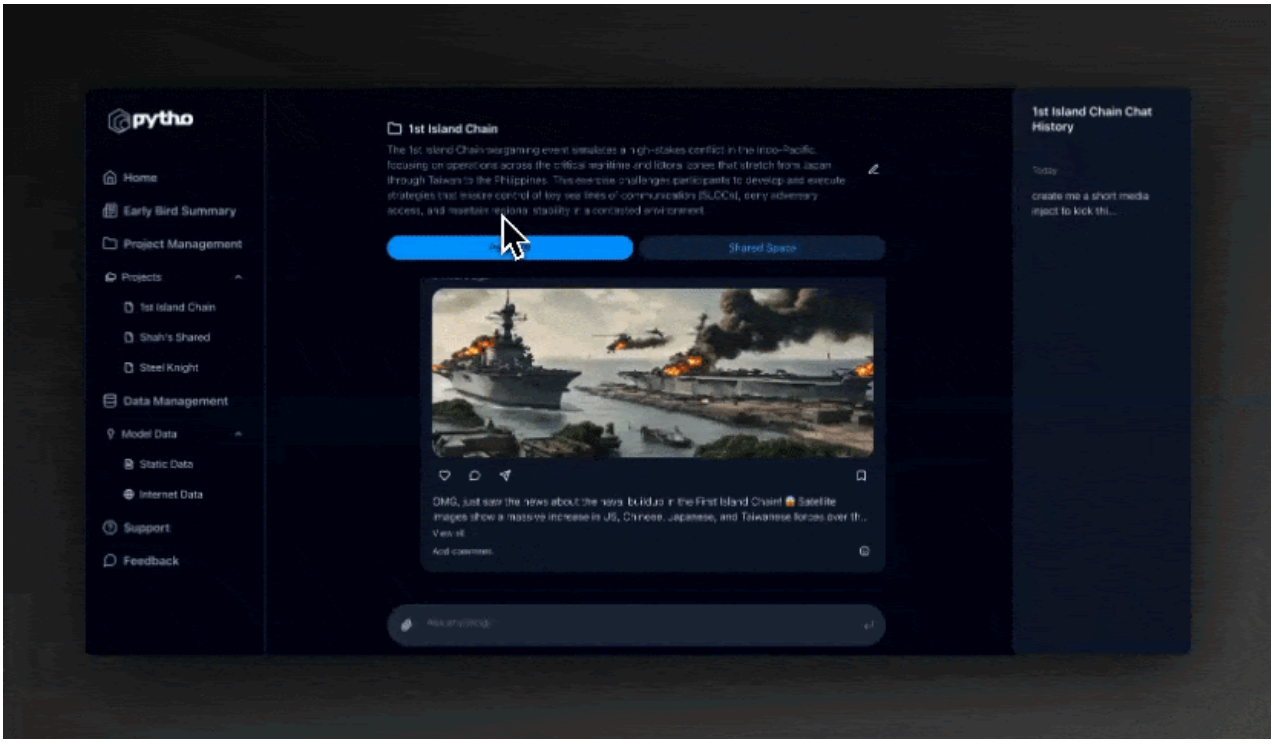
Invite your team members to join the project and collaborate; this functionality allows wargamers to structure organization and teaming around as many specific wargaming events as needed.



Share a Project

Personal Space / Shared Space

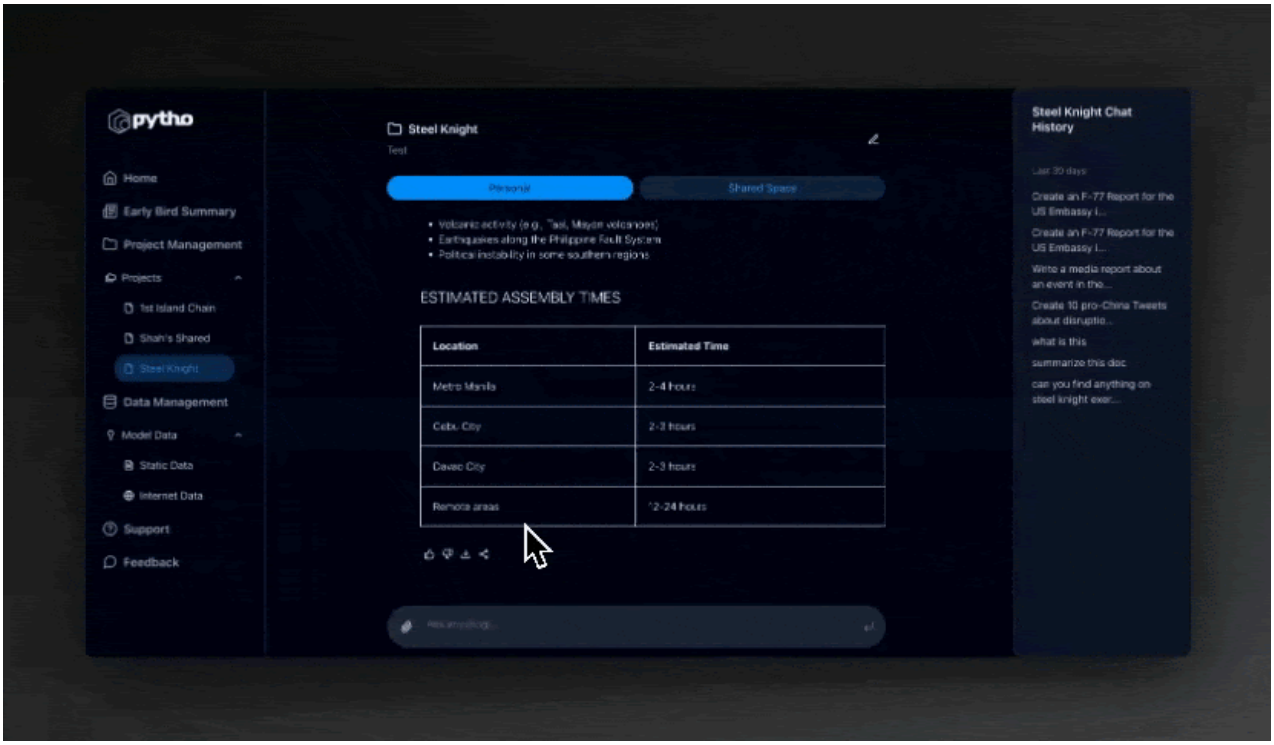
Maintain a separation between personal work and shared work within a project.



Personal and Shared Spaces

Share your Work

Publish your personal work to the project Shared Space when you are ready.



Sharing Workflow

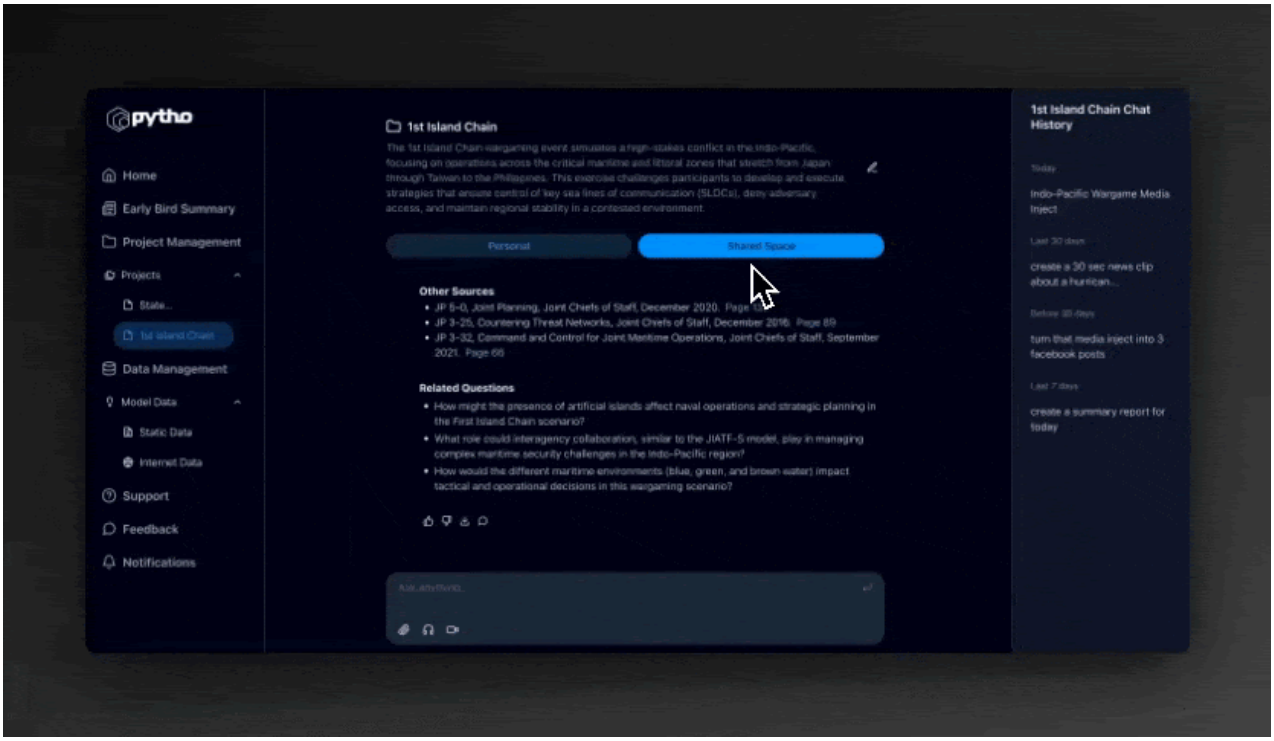
Commenting

Talk with your team within the War Room.

Commenting in Shared Spaces

Collaborate with your team within Shared Projects to enhance your wargames!

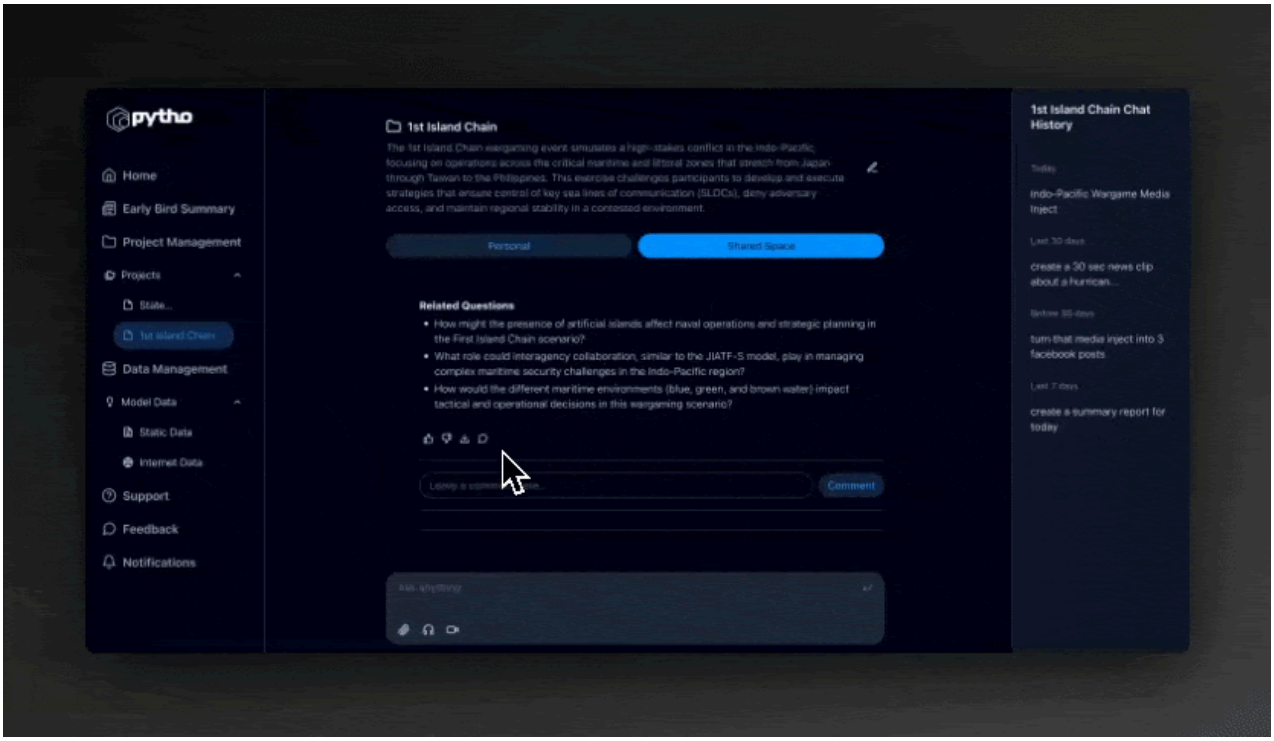
- Open a project
- Share an answer from your Personal Space to the Shared Space
- Select the "comment bubble" icon at the bottom of the Pytho response
- Leave a comment / tag your teammate
    - Only teammates included in the project can be tagged
        - The sidebar shows new notifications
        - Tagged teammates receive notifications
        - Teammates involved in that specific threat (prompt + answer) receive notifications



Commenting Workflow

Tag your Teammate

Leave a comment and/or tag your teammate to collaborate within Shared Spaces so you can work in parallel to improve communication and speed of creation.



Tagging Workflow

Notifications

Consolidated notification view to stay on top of updates.

Notification Page

The Notification Page is the hub for updates from teammates and Pytho.

You will receive notificagitons when:

- You are tagged
- Someone comments on your thread
- Someone comments on a thread you commented in
- Pytho releases updates

Notification Page

Products

The next-generation of intelligent product creation.

Wargaming Products

Creating products is a core functionality of the War Room. How long does it take a human team to generate OPORDs? Realistic and dynamic injects? Scenarios? Road to War? And how much research and data organization must be executed before the products can even be created?

The War Room takes all of the limitations out of product creation. Leverage immense amounts of data to instantly create products relevant to your wargame.

Two main types of product creation are supported:

- Injects
  - Audio
  - Facebook Posts
  - Role-Based Injects
  - Tweets
  - Video
- Products
  - Create Your Own
  - Available Products
    - ASCOPE/PMESII
    - After Action Review
    - Annex L
    - EAC Cable
    - F-77 Report
    - High-Value Target List
    - SITEMP
    - Spot Report

- Terrain Effects Matrix
- Threat Capability Statement
- Threat COA Statement
- Threat Description Table
- Warning Order

Injects

More dynamic and realistic wargames.

Wargame Injects

Injects are critical to creating dynamic, realistic wargames that challenge participants and drive meaningful decision-making; they introduce unexpected scenarios, operational friction, and evolving threats, forcing commanders and operators to adapt in real-time—just as they would in actual conflict. Well-designed injects test a team's ability to think critically, respond to crises, and refine strategies under pressure. Without them, wargames risk becoming predictable exercises rather than true stress tests for plans and systems. By simulating intelligence updates, cyber disruptions, logistical failures, or adversary actions, injects ensure that wargames deliver valuable insights, exposing weaknesses and strengthening readiness for real-world operations.

The War Room injects include:

- Audio
- Facebook Posts
- Role-Based Injects
- Tweets
- Video

Audio

Text-to-Speech!

Audio Injects

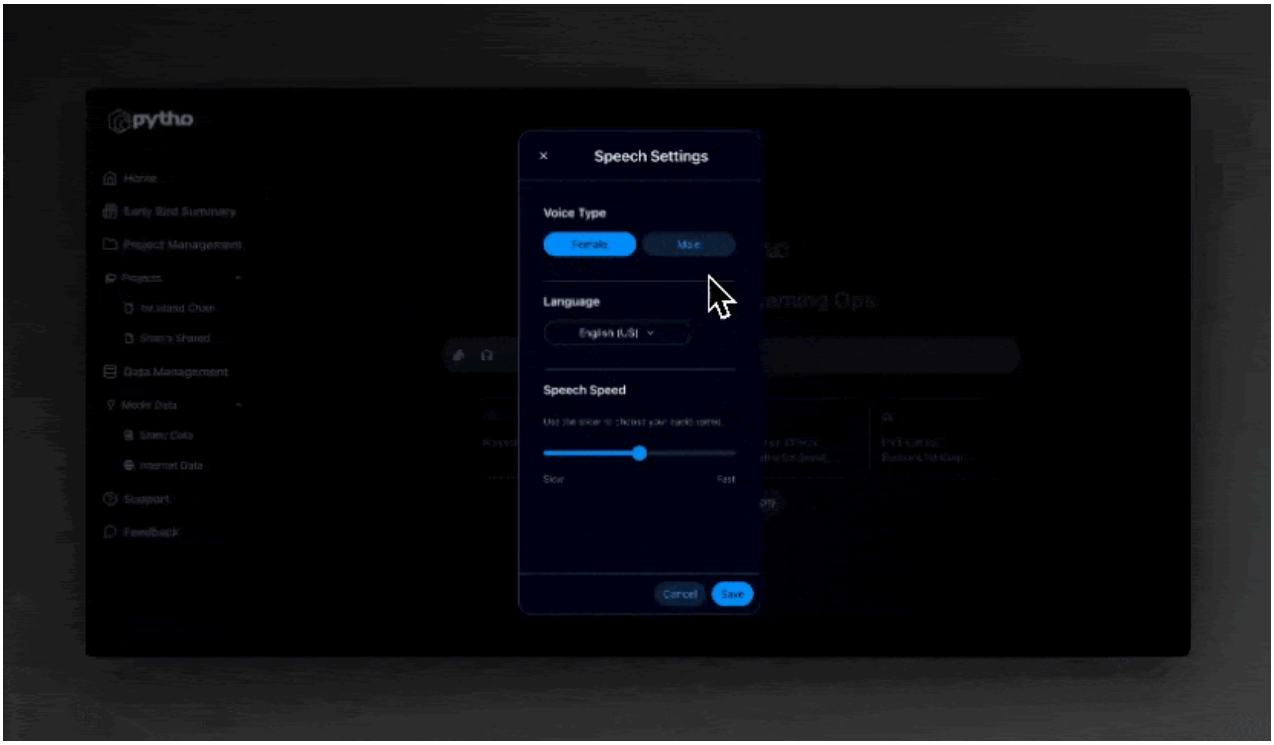
Create audio clips to add realism into wargaming events. You can change the voice type, language, and audio speed to create audio injects. These injects can be used to simulate news segments, podcasts, and more! Functionality includes the delivery of a transcript in the language of the user's choosing in case they want to edit it and create another clip.

Audio Menu

Open the Audio Menu

Voice Settings

Change the voice, language, and audio speed.

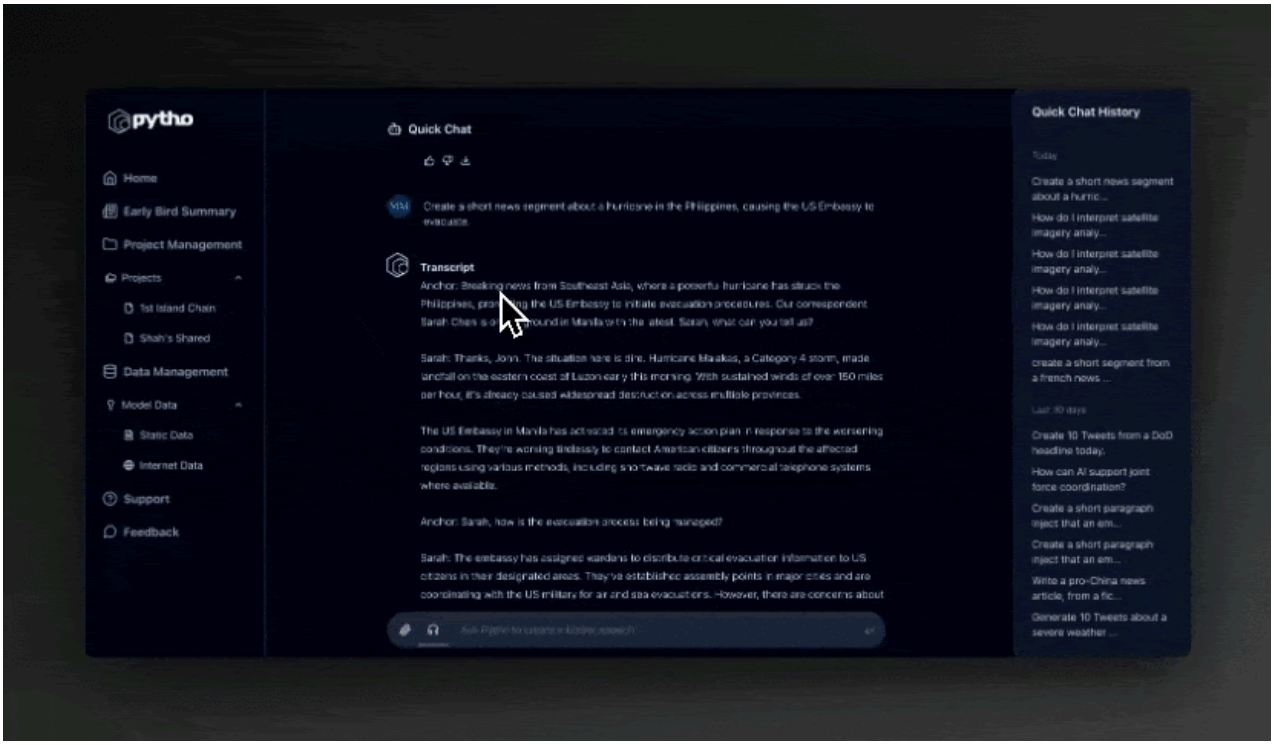


Voice Settings

Generation

See the text transcript and listen to the audio file!

Example Prompt: Create a short news segment about a hurricane in the Philippines, causing the US Embassy to evacuate.



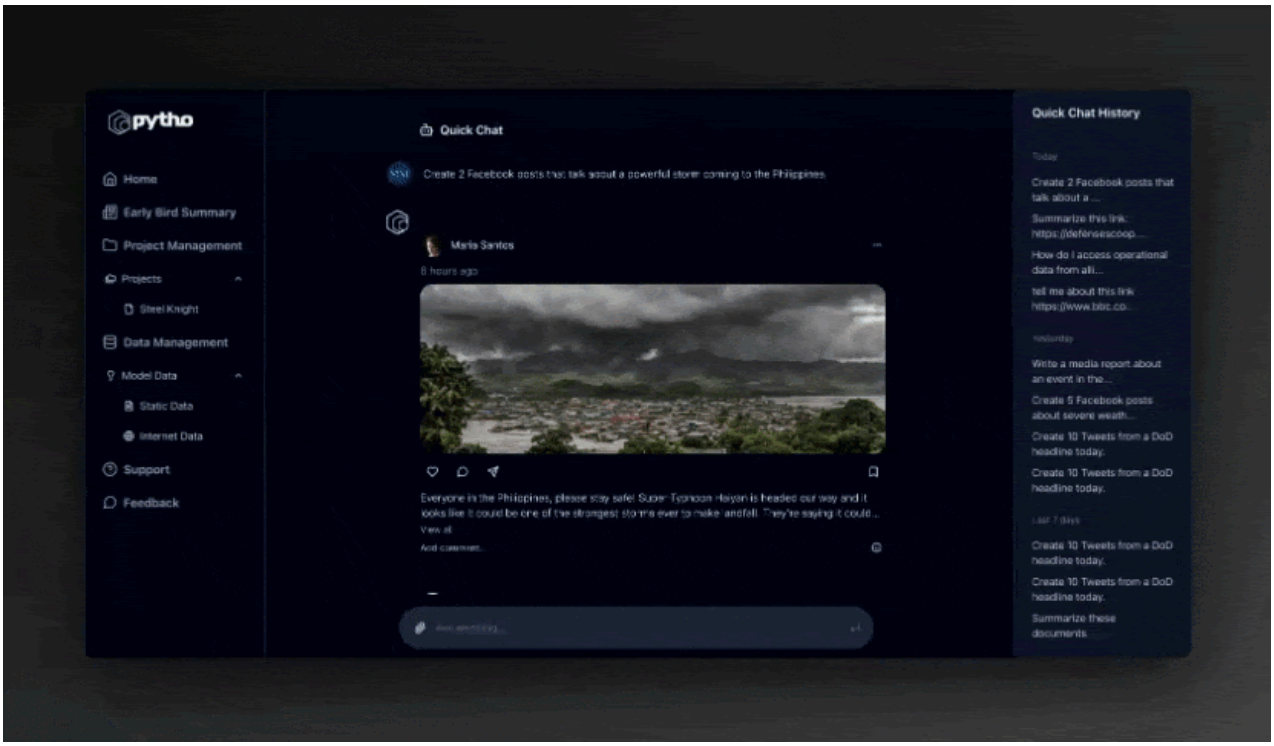
Generated Audio

Facebook Posts

Create realistic Facebook posts to simulate the information environment.

Facebook Posts

Simply request that the War Room generate a specific amount of Facebook Posts for any given topic and watch as they are created in seconds. Facebook Posts will include an assortment of relevant images for the topic.



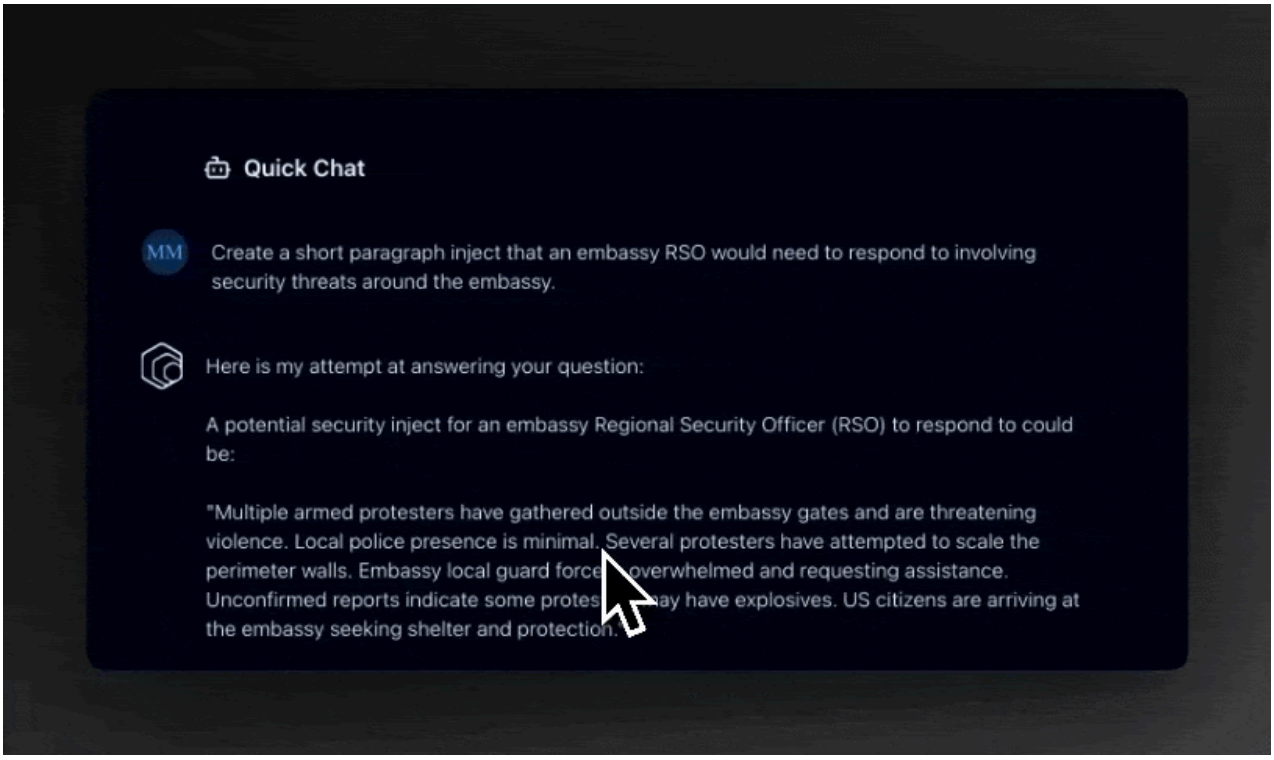
Facebook Posts

Role-Based Injects

Adapt your wargame to the participants.

Roles

Simply request that the War Room generate content for a specific role within the wargame. For example, ask about injects for a commander, a logistician, an intelligence analyst, an Embassy official, etc in order to adapt the wargame to the roles involved. The War Room will use data to formulate content for that specific role.



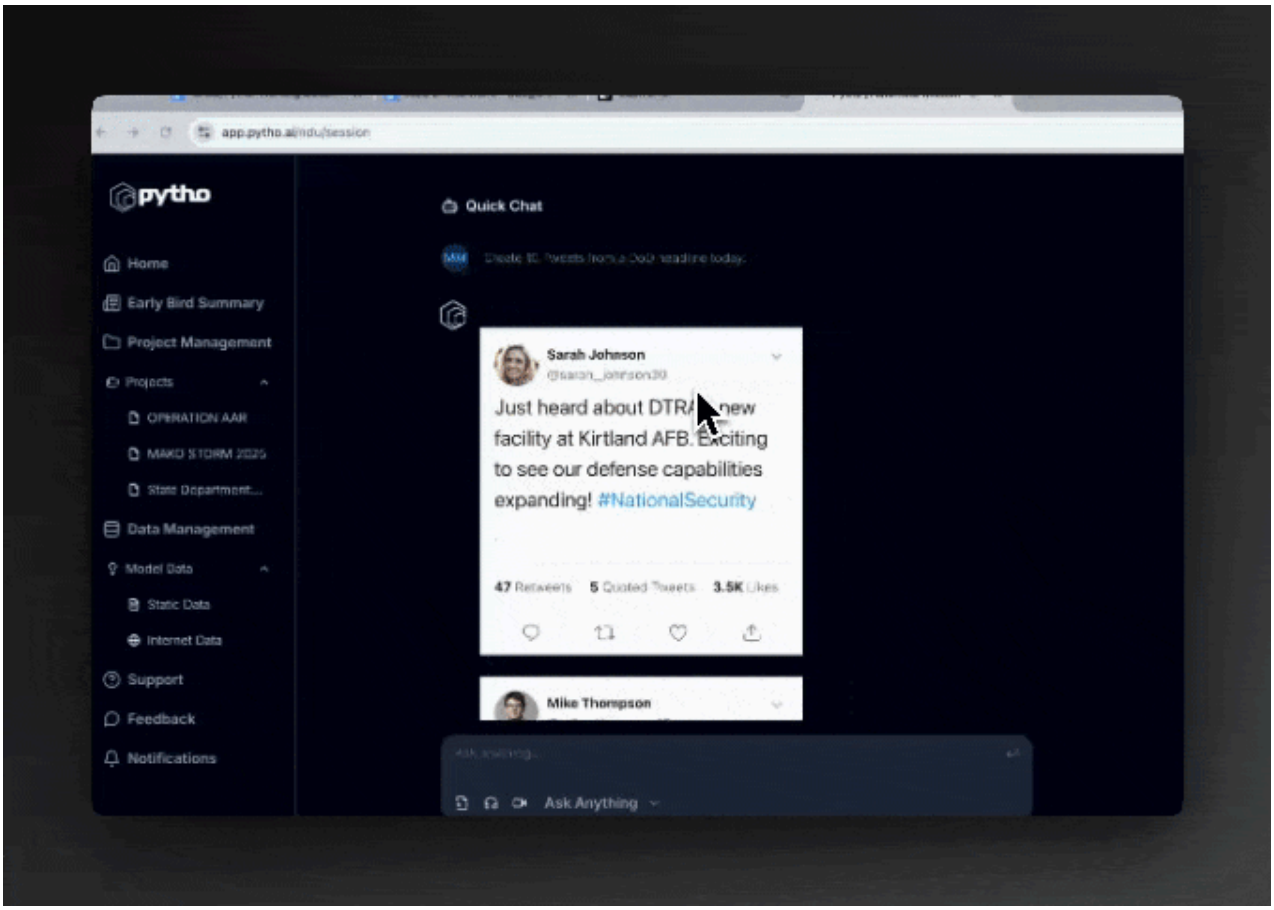
Embassy RSO Role

Tweets

Create realistic Tweets to simulate the information environment.

Tweets

Simply request that the War Room generate a specific amount of Tweets for any given topic and watch as they are created in seconds.



Tweet Creation

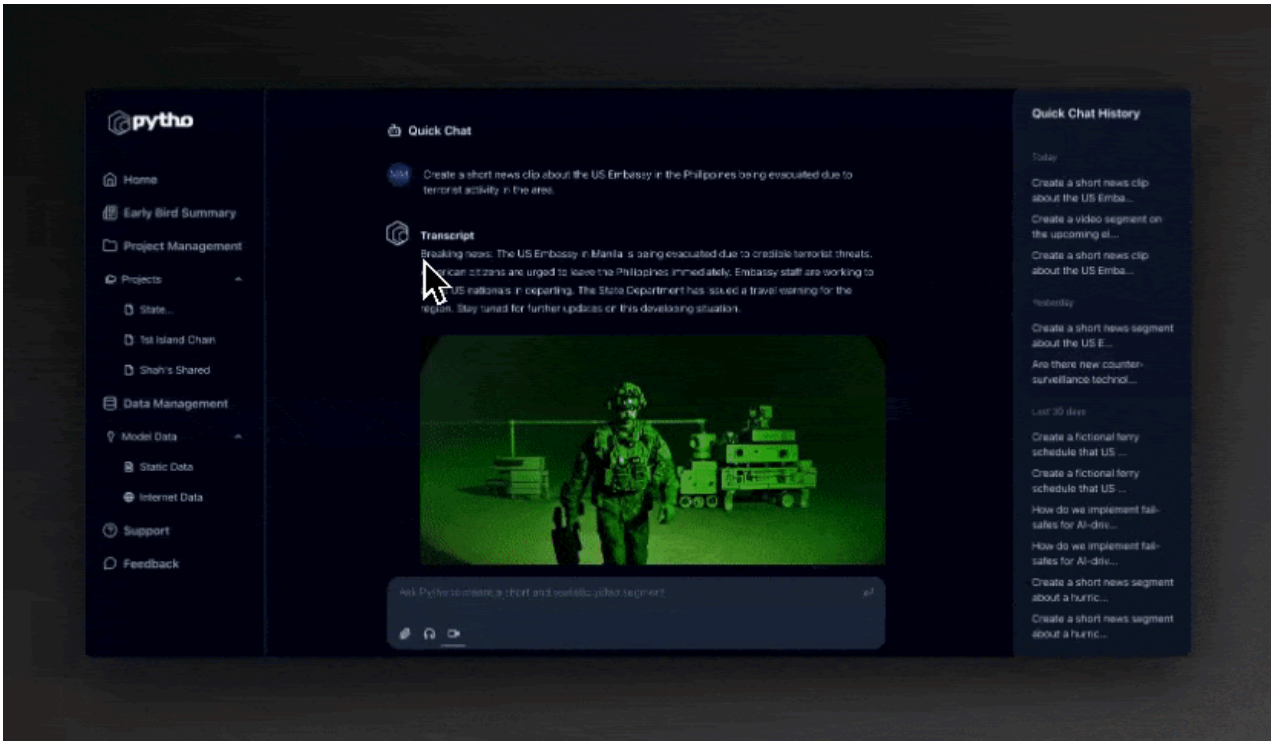
Video

Text-to-Video!

Custom Video Injects

Create short news segment video clips for your wargames! This new feature allows the users to create short news segments directly from prompts.

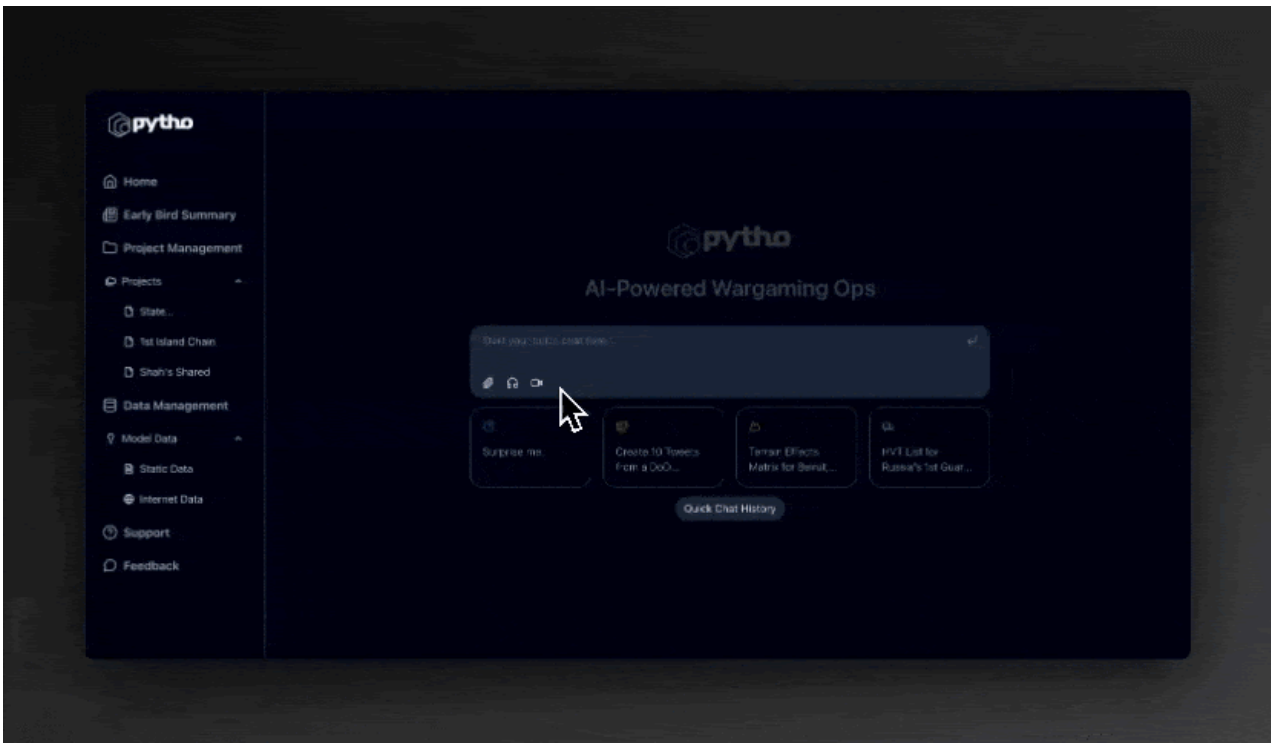
For example, a prompt could be “Create a short news clip about the US Embassy in the Philippines being evacuated due to terrorist activity in the area.”



Video Generation

Video Settings

Control the language, voice, transcript, and the images used in the settings menu.



Transcripts

Users can either have the War Room generate the video script or enter their own custom video script for Pytho to use when generating the video.

- Open the video filter menu
- Choose "Model Generated" to have models generate the transcript from your prompt
- Choose "Custom" to copy and paste a custom transcript for the video to use

Images

Users can either have the War Room generate the images for the video or they can upload up to 6 user-selected images to use when generating the video.

- Open the video filter menu
- Choose "Model Generated" to have models generate 2 images from your prompt

- Choose "Custom" under the "Images" section to upload your own internet images
  - Upload up to 6 images (jpeg/png)
  - The model will use the images when creating your video

Products

More dynamic and realistic wargames.

Products

Wargame products—such as Road to War briefs, Operations Orders (OPORDs), intelligence reports, and After-Action Reviews—are essential for structuring realistic and effective exercises. These materials provide the necessary context, constraints, and objectives that shape decision-making throughout the wargame. A well-crafted Road to War establishes the geopolitical and operational backdrop, while OPORDs translate strategy into executable plans. Intelligence reports introduce uncertainty and force participants to analyze evolving threats, just as they would in real-world scenarios. Without these products, wargames risk becoming abstract exercises rather than valuable training and planning tools. By integrating comprehensive wargame products, organizations ensure their exercises are grounded in operational realism, fostering better preparedness and strategic insight.

The two types of products include:

- Create Your Own Product
- Choose from Existing Products

Create Your Own Product

User-Generated Product Templates

Create Your Own Product

Want to create an After-Action Review? A Warning Order? A Road to War? Or another wargaming product that has a specific format? Simply upload a completed template of that product and watch the War Room learn and then generate it.

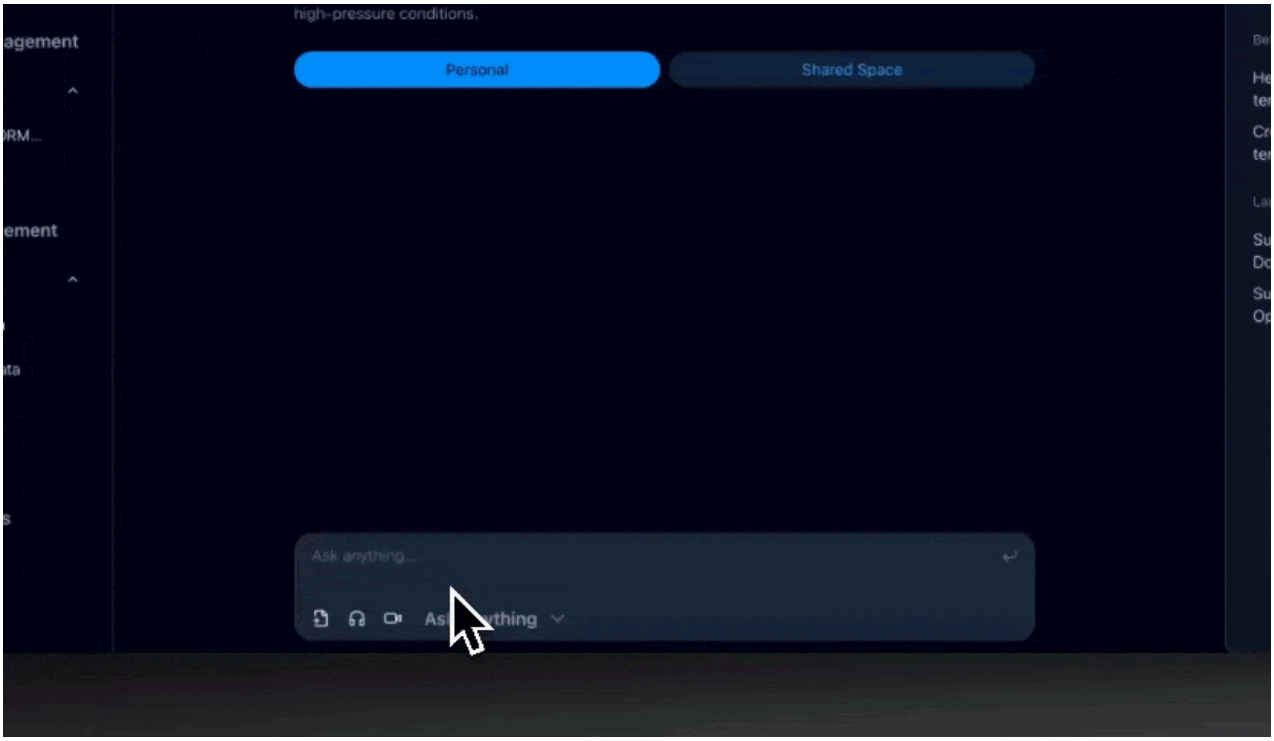
- Open the chat bar dropdown
- Select "Create Your Own"
- Fill out the Product Name / Overview
- Upload a completed example of the product i. Right now, Pytho supports text only products fewer than 5 pages
- Select "Save"
- Select the newly created product from the chat bar dropdown menu and prompt the War Room to generate it!
  - The product is generated in .docx format for easy viewing and editing
- The newly created product type is now available to all organization users

---

Example Walkthrough: Emergency Action Committee (EAC) Cable

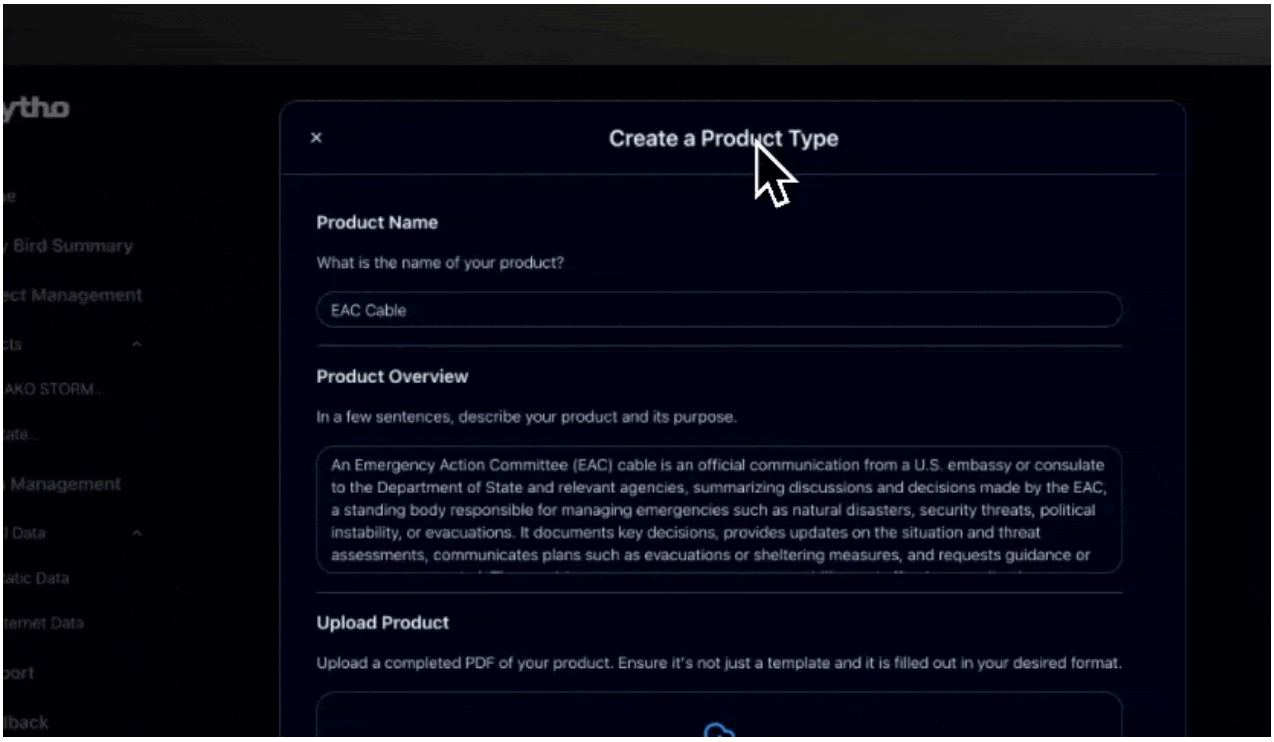
Teach the War Room abut EAC Cables and then watch it generate the product for any scenario!

Select the "Create Your Own" option



Create a Custom Product

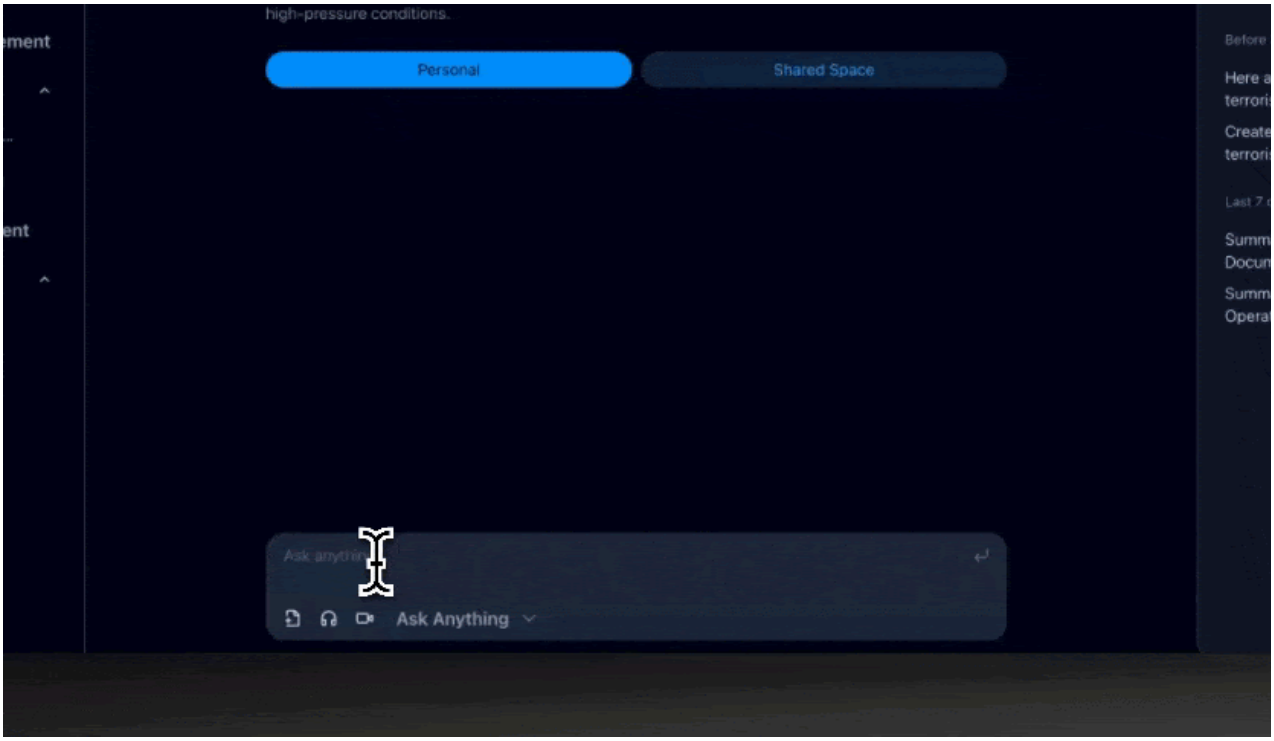
Fill in the required information including the Product Name and Overview. Then upload a completed example of the EAC Cable.



Custom Product Settings

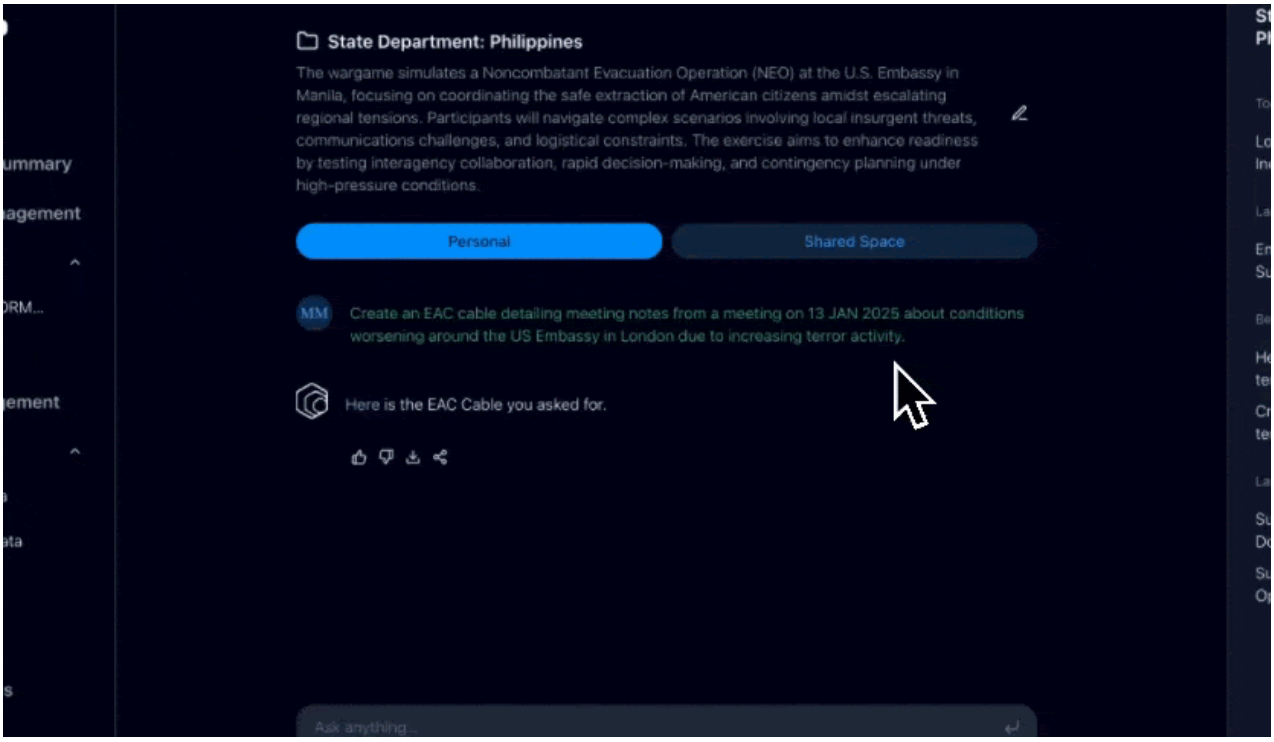
Now that the War Room understands the format and content of the EAC Cable, have it generate one for your scenario!

- Example Prompt: *Create an EAC cable detailing meeting notes from a meeting on 13 JAN 2025 about conditions worsening around the US Embassy in London due to increasing terror activity.*



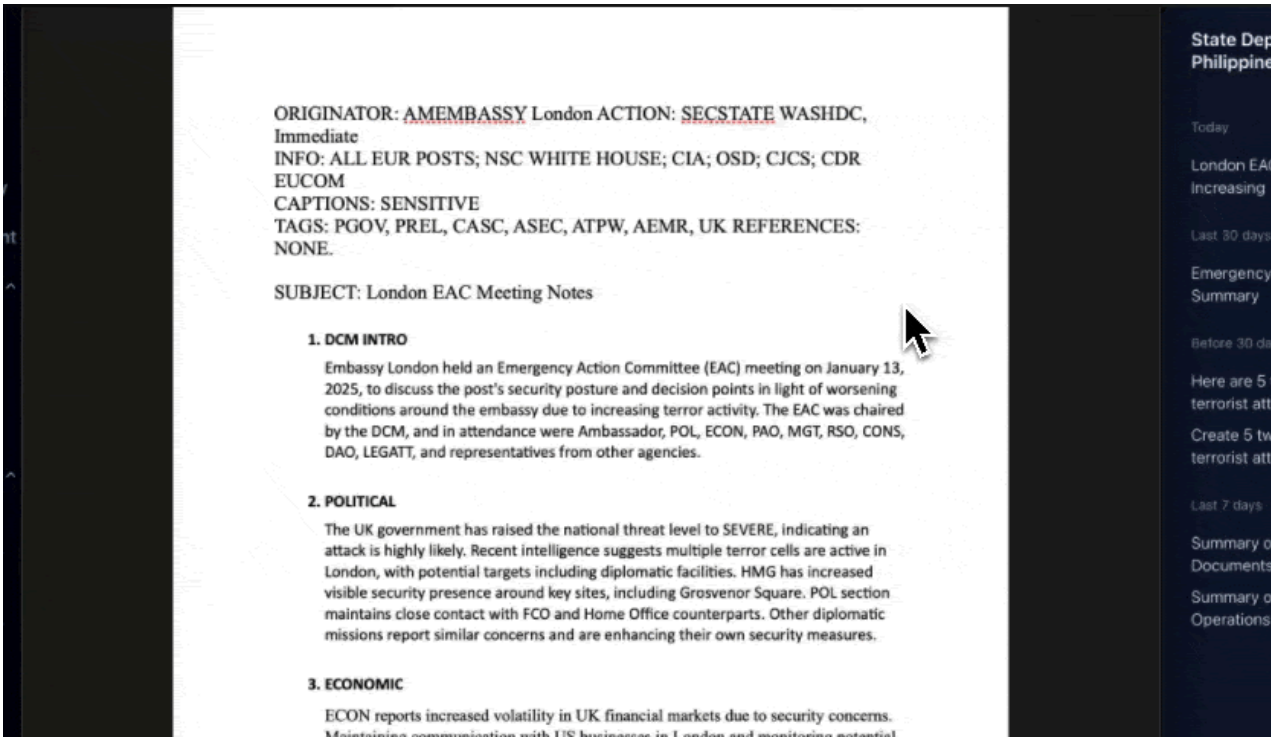
Prompt for the Product

Select the generated EAC Cable to open it in .docx



Open in .docx

Review and edit the generated EAC Cable



Review and Edit

Available Products

Growing list of products to choose from.

Choose from the Product Dropdown:

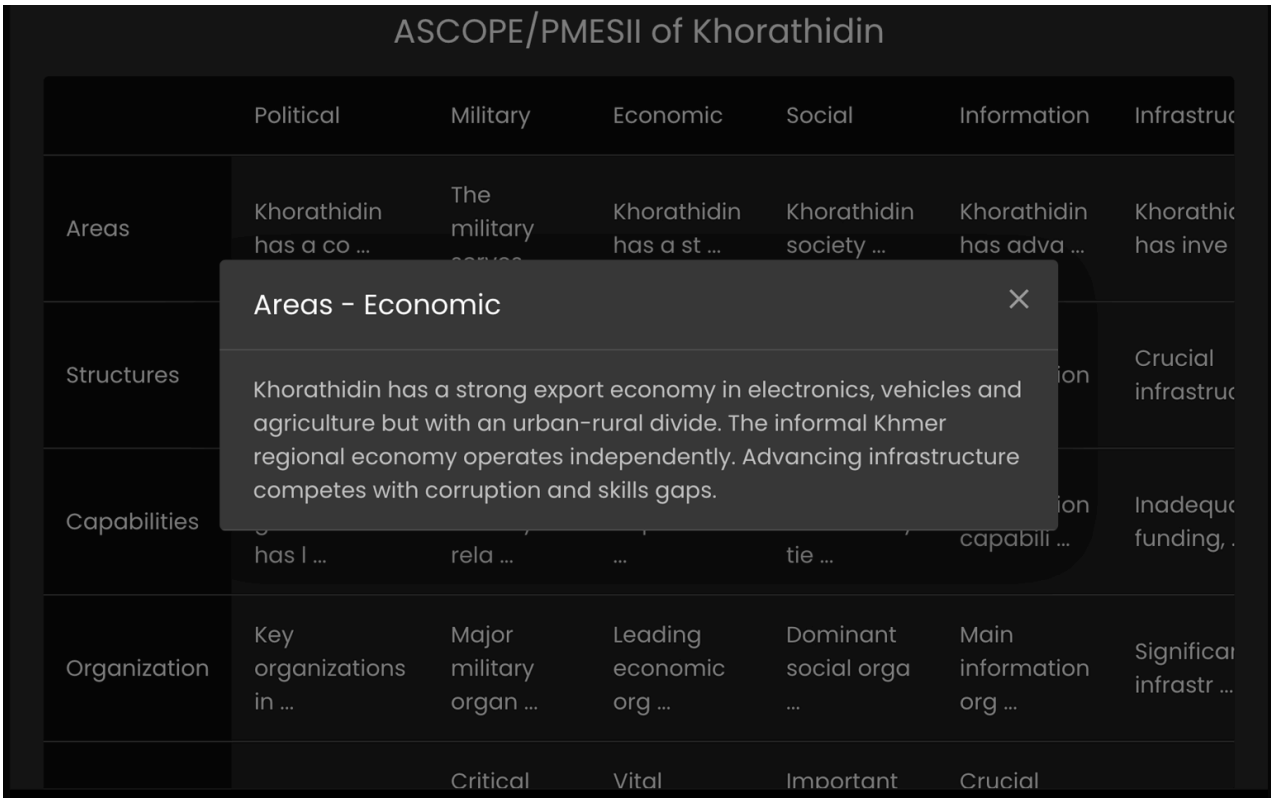
- ASCOPE/PMESII
- After Action Review
- Annex L
- EAC Cable
- F-77 Report
- High-Value Target List
- SITEMP
- Spot Report
- Terrain Effects Matrix
- Threat Capability Statement
- Threat COA Statement
- Threat Description Table
- Warning Order

ASCOPE/PMESII

How to create an ASCOPE/PMESII Cross-Walk

Example Prompt

`Create an ASCOPE/PMESII table for Khorathidin`



ASCOPE/PMESII for Fictional Country

Overview

Civil considerations are the influence of manmade infrastructure, civilian institutions, and attitudes and activities of civilian leaders, populations, and organizations within an area of operations on the conduct of military operations.

Commanders and staffs analyze civil considerations in terms of these characteristics.

ASCOPE

- **Areas**: Where do people live, work, play?
- **Structures**: Why are these structures important, and what are they?
- **Capabilities**: Use the SWEATMSO (Sewer, Water, Electricity, Academic, Trash, Medical, Security, Other) acronym to list what capabilities are resident in the Operating Environment
- **Organizations**: What are different groups in the areas?
- **People**: How do people organise and interact? Who are the leaders?
- **Events**: When and what events are important to people? Festivities, celebrations, weather events, migratory events

PMESII

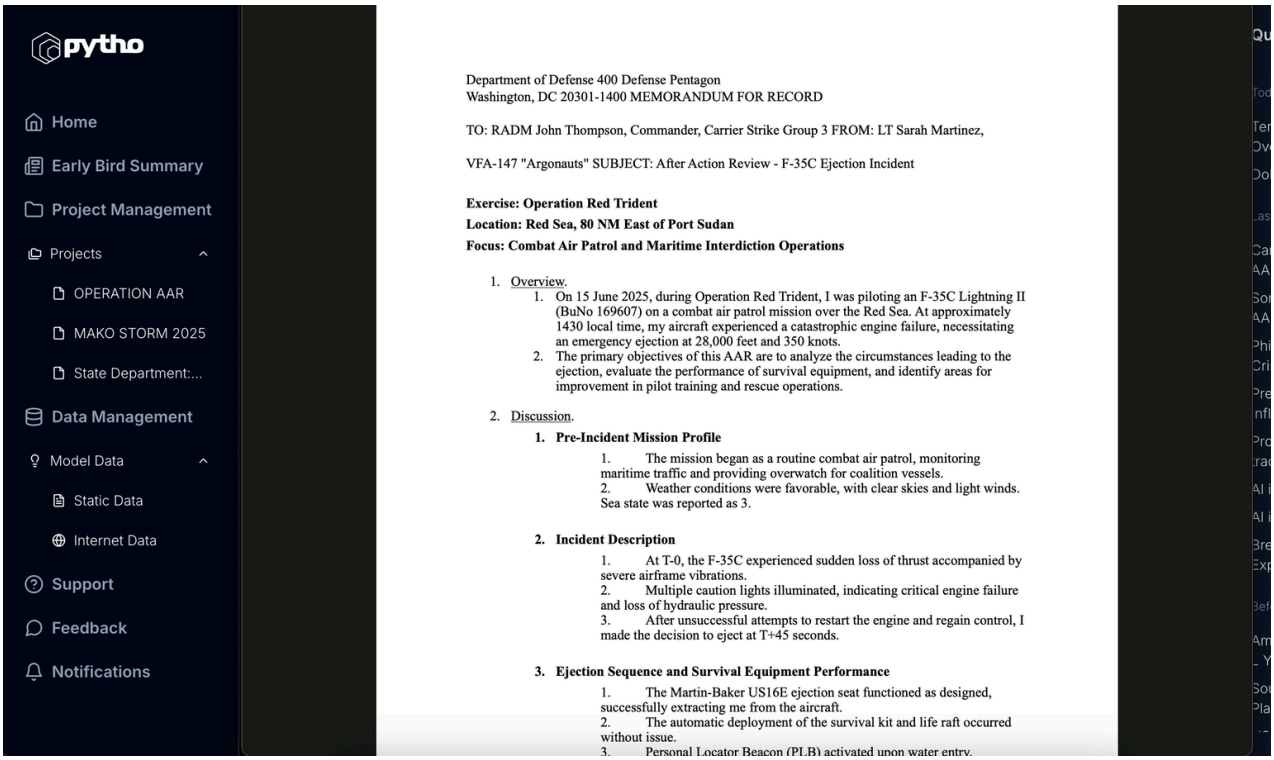
- **Political**: The distribution of responsibility and power at all levels of government and includes formal as well as informal structures.
- **Military**: The military capabilities of all security forces (Host Nation, insurgents, local militia, and police).
- **Economic**: General economic categories of the AO (energy, raw materials, labour distribution, income/food distribution, goods/services, and illicit markets)
- **Social**: Societies within an operational environment (a population whose members are subject to the same political authority, occupy a common territory, have a common culture and share a sense of identity)
- **Information**: The collection, access, use, manipulation, distribution and reliance on data, media and knowledge systems (both civilian and military) by the local communities
- **Infrastructure**: The basic facilities, services and installations needed for a community or society to function

After Action Review

How to Create an After Action Review

Example Prompt

`Create an After Action Review from the POV of a US F-35 pilot who had to eject during operations over the Red Sea.`



After Action Review

Overview

An After-Action Review (AAR) is a structured evaluation process used to assess the performance of an operation, exercise, or training event. It reviews objectives, compares actual outcomes with expected results, and identifies strengths, weaknesses, and lessons learned to improve future missions. AARs help refine tactics, techniques, and procedures (TTPs) by analyzing what worked well and what needs adjustment. They can be formal, involving detailed reports after major operations, or informal, conducted immediately after an event as a quick discussion. Widely used across the military, intelligence, and operational planning

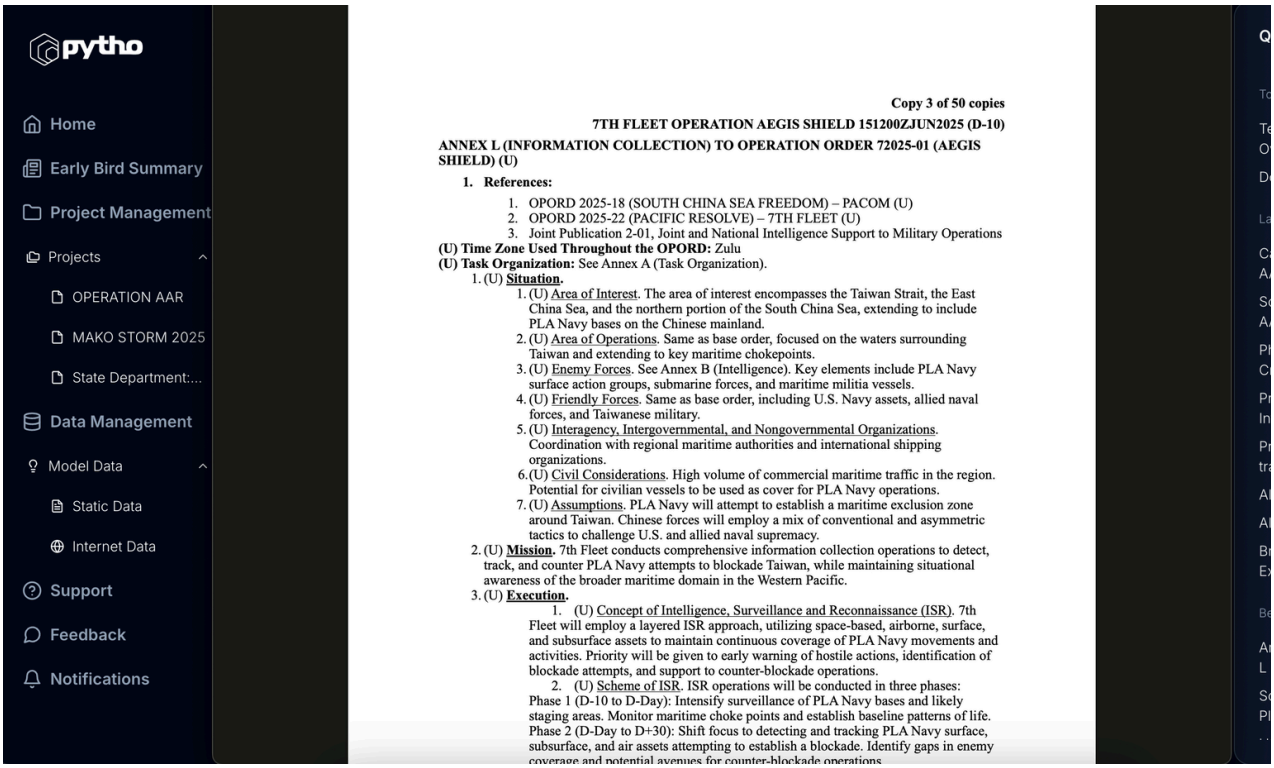
communities, AARs foster continuous learning, enhance decision-making, and ensure mission readiness.

Annex L

How to Create an Annex L

Example Prompt

```
Create an Annex L for the US Navy for collection operations against the PLA Navy and a planned blockade of Taiwan.
```



Annex L

Overview

Annex L in an OPORD (Operations Order) is the Information Collection annex, outlining how intelligence, surveillance, and reconnaissance (ISR) activities will support the mission. It details priority intelligence requirements (PIRs), ISR assets, and tasking to ensure commanders have the necessary information for informed decision-making. This annex includes the overall purpose of the collection plan, available ISR platforms such as UAVs, satellites, and human intelligence (HUMINT) sources, and the process for gathering, processing, and disseminating intelligence. It also establishes reporting requirements, ensuring intelligence is delivered in a

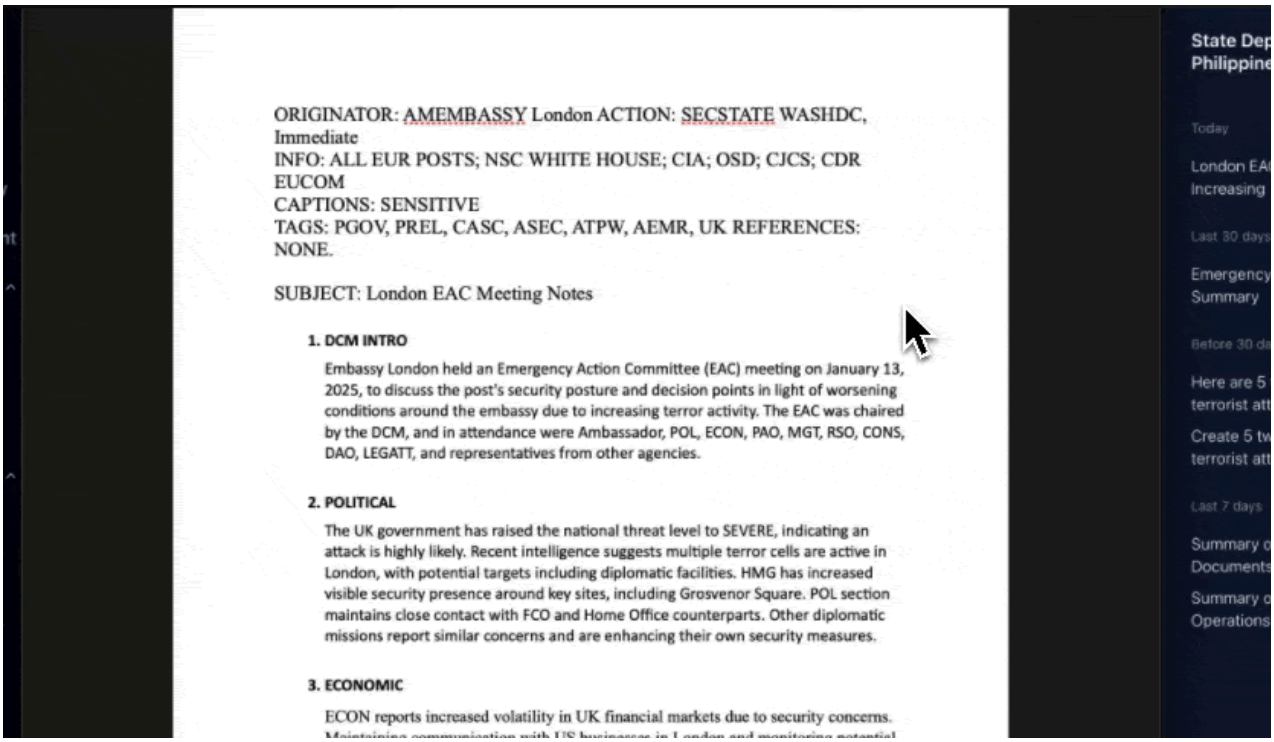
timely and structured manner. Additionally, Annex L coordinates ISR efforts across units and echelons to maintain a synchronized intelligence effort. Its importance lies in maximizing intelligence effectiveness, enhancing situational awareness, and enabling commanders to anticipate enemy actions, ultimately driving mission success.

EAC Cable

How to create an Emergency Action Committee Cable

Example Prompt

`Create an EAC Cable detailing meeting notes from a meeting on 13 JAN 2025 about conditions worsening around the US Embassy in London due to increasing terror activity.`



ORIGINATOR: AMEMBASSY London ACTION: SECSTATE WASHDC, Immediate
INFO: ALL EUR POSTS; NSC WHITE HOUSE; CIA; OSD; CJCS; CDR EUCOM
CAPTIONS: SENSITIVE
TAGS: PGOV, PREL, CASC, ASEC, ATPW, AEMR, UK REFERENCES: NONE.

SUBJECT: London EAC Meeting Notes

1. DCM INTRO

Embassy London held an Emergency Action Committee (EAC) meeting on January 13, 2025, to discuss the post's security posture and decision points in light of worsening conditions around the embassy due to increasing terror activity. The EAC was chaired by the DCM, and in attendance were Ambassador, POL, ECON, PAO, MGT, RSO, CONS, DAO, LEGATT, and representatives from other agencies.

2. POLITICAL

The UK government has raised the national threat level to SEVERE, indicating an attack is highly likely. Recent intelligence suggests multiple terror cells are active in London, with potential targets including diplomatic facilities. HMG has increased visible security presence around key sites, including Grosvenor Square. POL section maintains close contact with FCO and Home Office counterparts. Other diplomatic missions report similar concerns and are enhancing their own security measures.

3. ECONOMIC

ECON reports increased volatility in UK financial markets due to security concerns.

EAC Cable

Overview

An Emergency Action Committee Cable is an official communication from a U.S. embassy or consulate to the Department of State and relevant agencies, summarizing discussions and decisions made by the EAC, a standing body responsible for managing emergencies such as natural disasters, security threats, political instability, or evacuations. It documents key decisions, provides updates on the situation and threat assessments, communicates plans such as evacuations or sheltering measures, and requests guidance or resources as needed. These cables

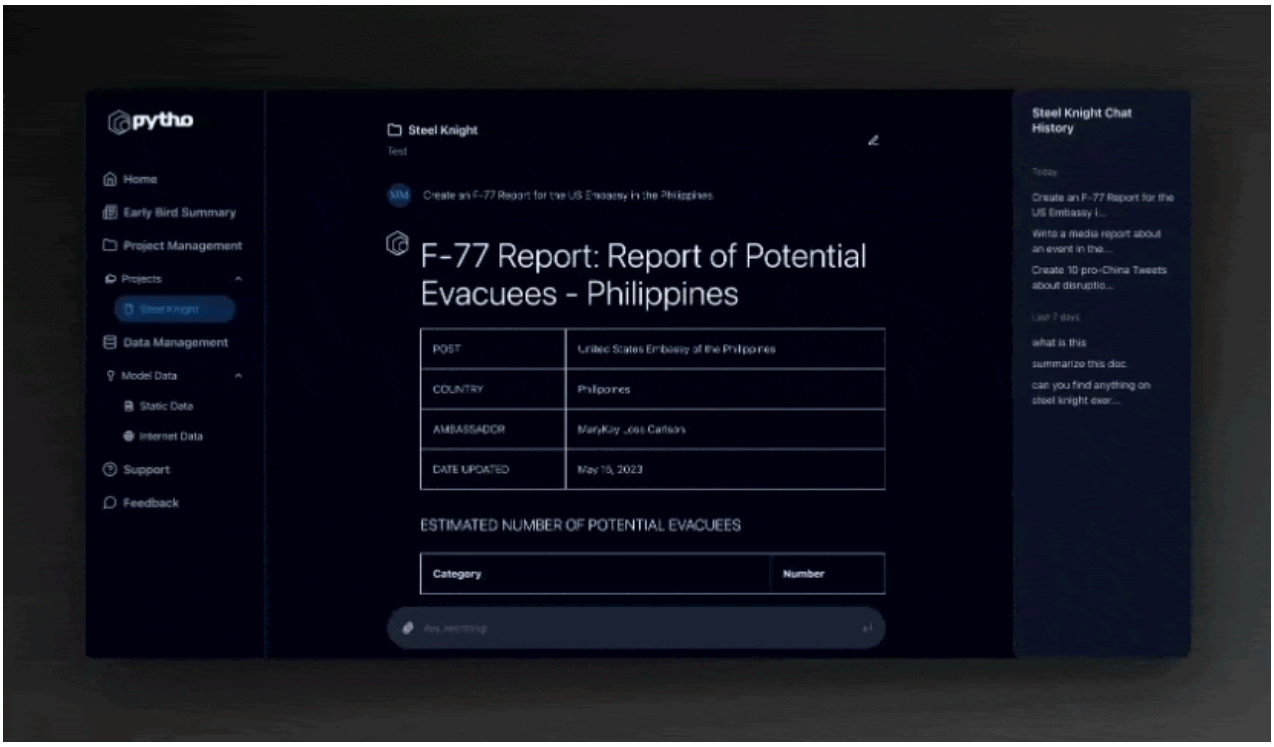
ensure transparency, accountability, and effective coordination, enabling timely support and consistent responses across U.S. diplomatic posts during crises.

F-77 Report

How to create an F-77 Report

Example Prompt

```
Create an F-77 Report for the US Embassy in Manila.
```



F-77 Report

Overview

An Embassy F-77 report, officially known as the "Report of Potential Evacuees," is an annual document prepared by U.S. embassies and consulates to estimate the number of individuals who might require evacuation assistance in emergency situations. This report plays a pivotal role in evacuation planning and crisis management, providing essential data to both the Department of State and the Department of Defense.

The F-77 report includes estimates of U.S. citizens residing or traveling within the embassy's jurisdiction, as well as third-country nationals (TCNs) who might request

evacuation assistance. These estimates are crucial for developing comprehensive evacuation strategies and coordinating with other nations to ensure effective burden-sharing during crises.

However, the accuracy of F-77 reports can be challenging to maintain. Factors such as voluntary citizen registration, seasonal tourism fluctuations, and the presence of dual nationals complicate the estimation process. Consequently, these reports may underestimate the actual number of potential evacuees, posing challenges for evacuation operations.

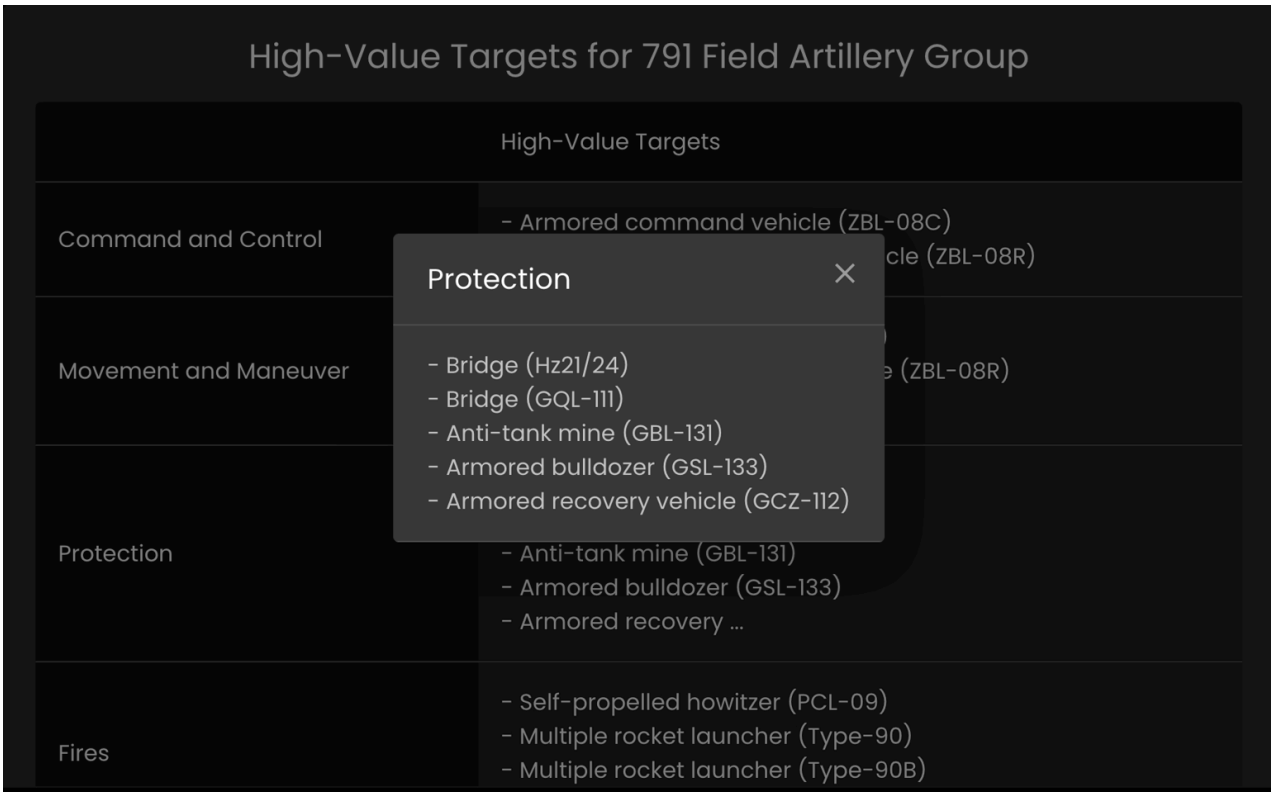
To enhance the reliability of F-77 reports, embassies are encouraged to update them regularly and document the methodologies and data sources used in their estimations. This practice aims to improve the accuracy of evacuation planning and ensure that resources are appropriately allocated during emergencies.

High-Value Target List

How to create a HVT List

Example Prompt

```
Create a high-value target list for 791 Field Artillery Group
```



791 Field Artillery Group HVTs

Overview

A High-Value Target List is a prioritized compilation of individuals, assets, or locations that are considered critical to an adversary's operations and whose removal, capture, or neutralization would significantly impact enemy capabilities. These targets are typically selected based on their strategic, operational, or tactical importance in military, intelligence, or law enforcement operations.

Types of High-Value Targets:

- **Leadership Figures:** Key decision-makers, commanders, or terrorist leaders.
- **Critical Infrastructure:** Facilities essential to enemy operations, such as communication hubs, weapons depots, or supply lines.
- **Strategic Weapons Systems:** Advanced missile systems, aircraft, or cyber warfare capabilities.
- **Financial Networks:** Key individuals or entities funding hostile activities.

HVT lists are used to prioritize efforts in targeting campaigns. These lists are created based on intelligence assessments and are continually updated as new information becomes available. In counterterrorism, for example, the U.S. military and intelligence agencies use HVT lists to track and neutralize threats like terrorist leaders or insurgent networks.

Related Concepts:

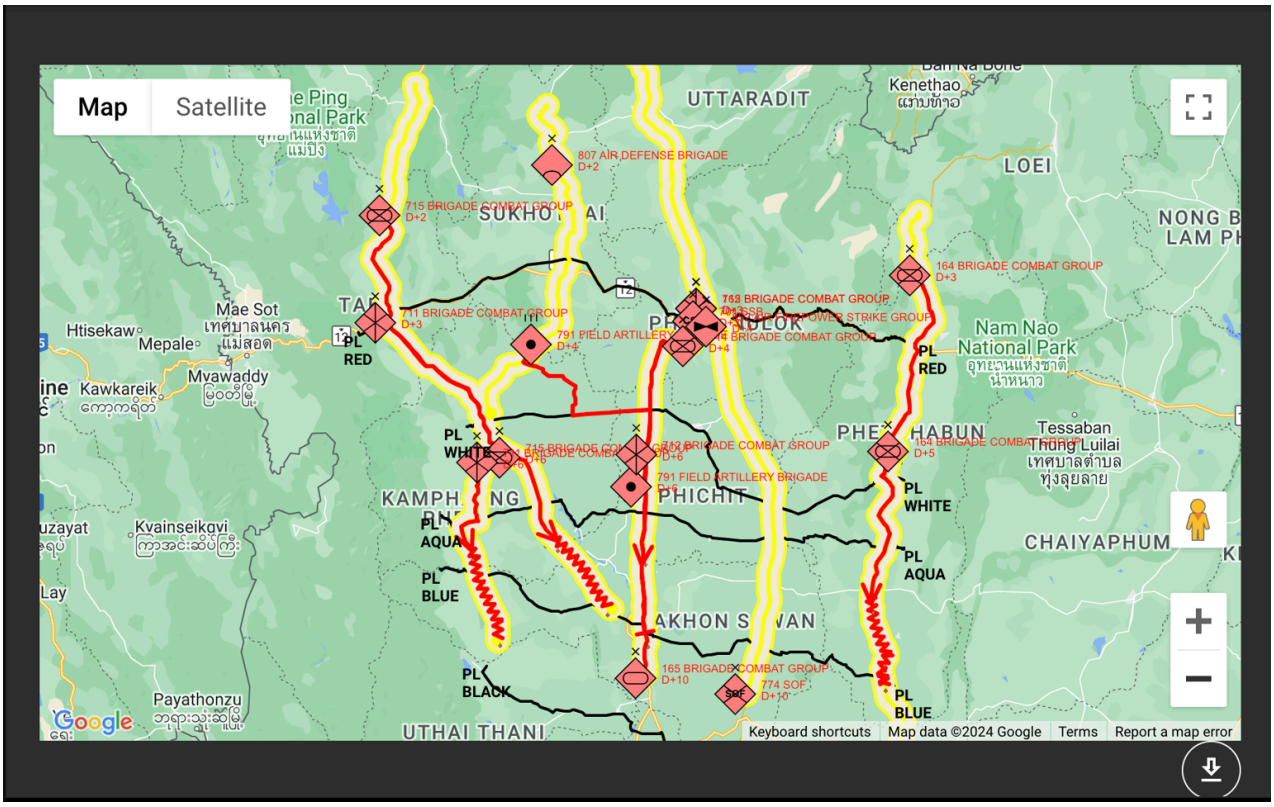
- **High-Payoff Target (HPT):** A subset of HVTs, these targets provide a direct tactical advantage when engaged or neutralized.
- **Joint Prioritized Effects List (JPEL):** Used in coalition operations, particularly in counterterrorism efforts, to coordinate targeting across multiple agencies.

SITEMP

How to create a Situation Template

Example Prompt

```
Create a SITEMP for the 71st ACG
```



71st ACG SITEMP

Overview

A Situation Template (SITEMP) is a depiction of assumed adversary dispositions, based on that adversary's preferred method of operations and the impact of the operational environment if the adversary should adopt a particular course of action.

A situation template graphic depicts a potential threat COA as part of a particular threat operation. It usually depicts the most critical point in the operation as agreed upon by the commander, the operations officer, and the intelligence officer. However, the operation may require the preparation of several templates as

overlays representing different “snapshots in time,” starting with the threat’s initial array of forces. These snapshots in time are useful in depicting:

- Points where the threat might adopt branches or sequels to the main COA.
- Places where the threat is especially vulnerable.
- Other key points in the battle, such as initial contact with friendly forces.

Situation templates are developed using the threat’s current situation, based on threat doctrine and the effects of terrain, weather, and civil considerations. The situation template may include:

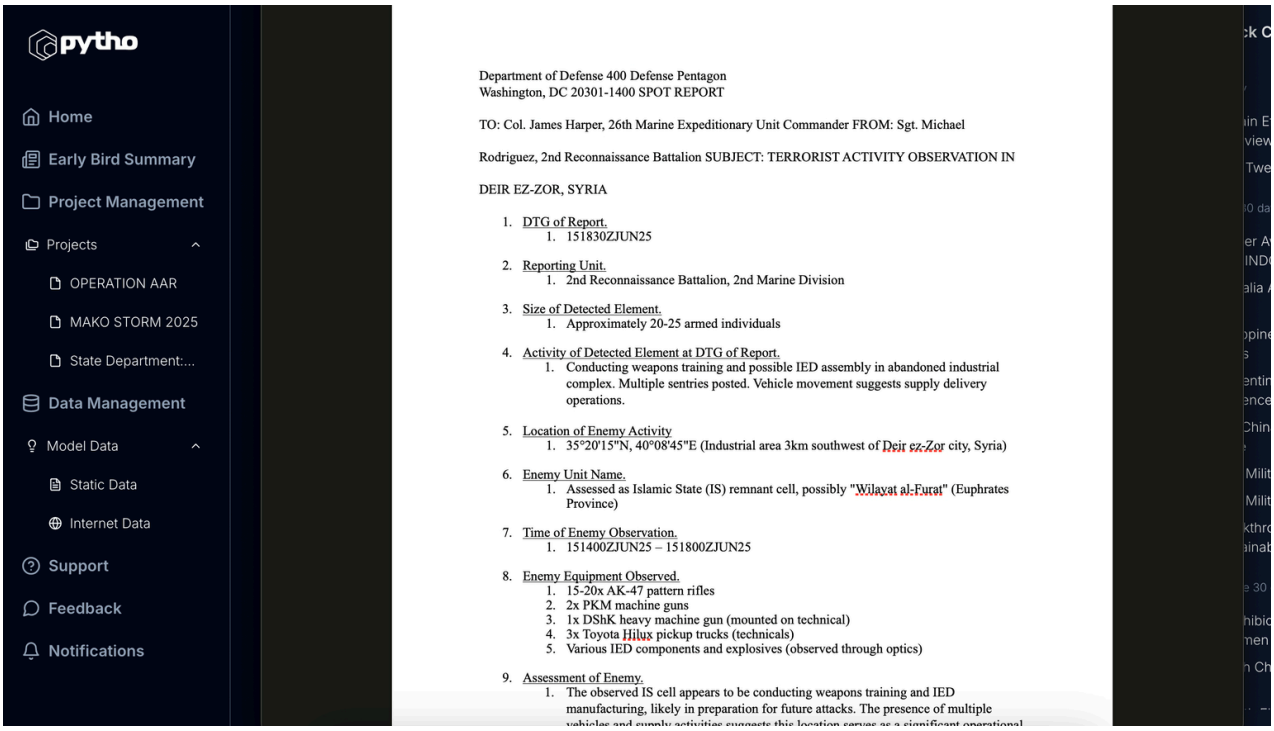
- Doctrinal rates of march
- Time phase lines
- Threat composition, disposition, and strength
- Key threat weapon systems range fans
- Task, purpose, method, and end state
- AAs
- NAIs
- Graphic control measures, including but not limited to:
    - Obstacles (natural and reinforcing)
    - Engagement areas

SPOTREP

How to Create a Spot Report

Example Prompt

`Create a SPOTREP for a US Marine recon team observing a known terrorist group in Syria.`



SPOTREP

Overview

A SPOTREP (Spot Report) is a concise, time-sensitive intelligence report used by military units to relay real-time observations of enemy activity, significant events, or battlefield developments. It follows a standardized format to quickly communicate critical details such as the date-time group (DTG), reporting unit, enemy size, activity, location, unit identification, time of observation, equipment observed, and an assessment of the enemy's intent or capabilities. SPOTREPs enable commanders to make rapid, informed decisions by providing immediate situational

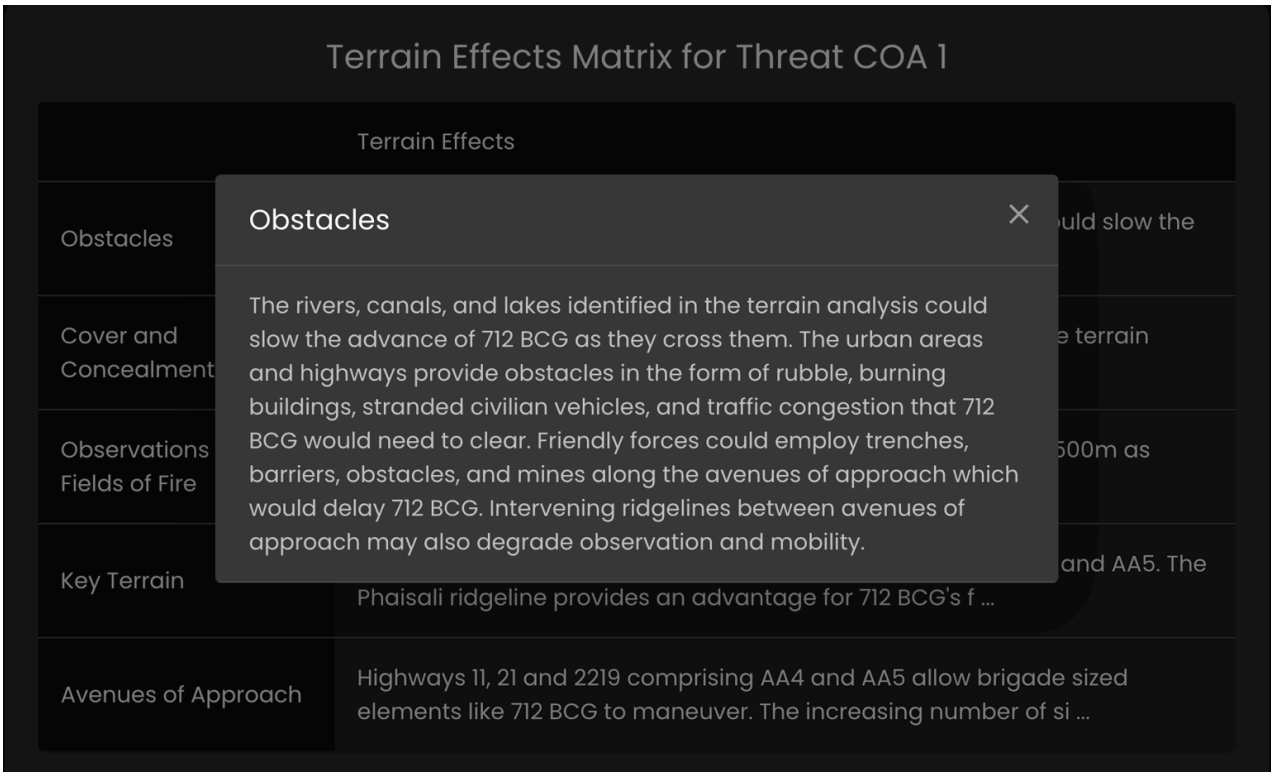
awareness and are commonly used in reconnaissance, surveillance, and combat operations.

Terrain Effects Matrix

How to create a Terrain Effects Matrix

Example Prompt

`Create a Terrain Effects Matrix for the enemy forces involved in Threat Course of Action 1`



Terrain Effects Matrix for TCOA 1

Overview

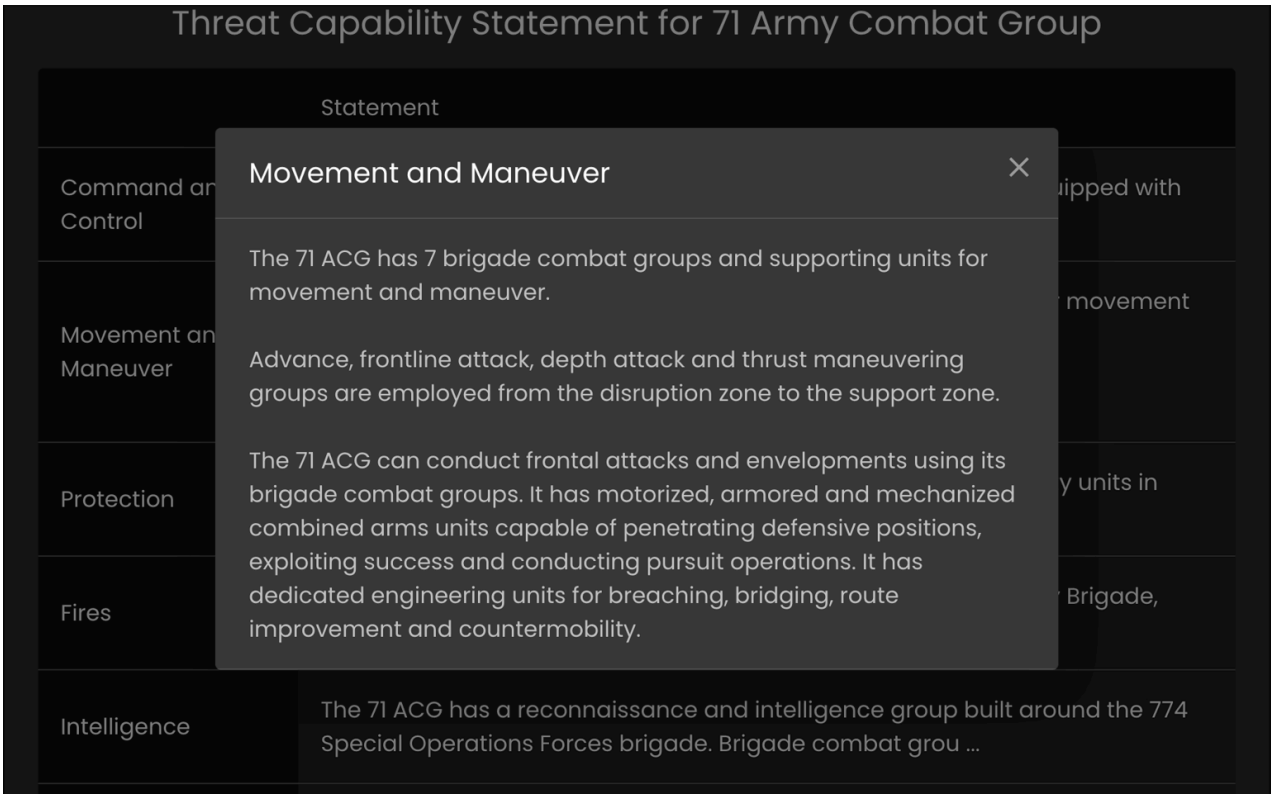
A Terrain Effects Matrix describes OAKOC factor effects on friendly and threat operations. Analysts must relate the evaluation of terrain effects on the COAs available to friendly and threat forces.

Threat Capability Statement

How to create a Threat Capability Statement

Example Prompt

`Create a Threat Capability Statement for the 71st ACG`



71st ACG Threat Capabilities

Overview

A threat capability statement can be a narrative, table, or visual representation of the data. It identifies a particular action the threat has the capability to complete, and the tactics the threat prefers to accomplish its objectives. It addresses a major unit's operations portrayed on the threat template and the activities of each threat capability.

Threat COA Statement

How to create a Threat COA Statement

Example Prompt

`Write a Threat Course of Action Statement for Threat COA 2`

Mission: 71 Army Combat Group (ACG) conducts a simple envelopment of a fortified enemy with an overall operational objective to destroy I MEF.

Advance (D+3): 714 Brigade Combat Group (BCG) (Advance Group) consolidates after their initial attacks to PL WHITE and continues to conduct reconnaissance south to PL AQUA on AA2, AA3, and AA4. The remainder of 71 ACG occupy assembly areas vicinity PL RED.

Unfold (D+4): 71 ACG attacks with four Frontline Attack Groups abreast. 774 SOF (Recon and Intel Group) infiltrates south to PL BLACK to identify Sixth Army defensive positions and high payoff targets. 711 BCG attacks along AA2 to fix 1MD (I MEF) vicinity PL BLUE. 712 BCG passes through 714 BCG and attacks along AA3 to fix 1MD (I MEF) from the north. 164 BCG attacks along AA4 and AA5 to fix I Corps vicinity PL BLUE. 715 BCG (main effort) continues south on AA2 and occupies attack positions in the Frontline Zone.

Initiate (D+8): 791 FA (Artillery Group) moves south and shifts fire support focus to counterfire, obstacle reduction, and disruption efforts in the deep area. 701 SSB (Rear Area Support Group) and 852 AV (Air Firepower Strike Group) begin operating out of PHITSANULOK to support the attack.

Penetrate (D+10): 715 BCG (main effort) penetrates 2KD (I MEF) defensive positions vicinity SAWANG AROM. 165 BCG (Depth Attack Group) follows 715 BCG to envelop I MEF from the west.

Continuing Operations: 714 BCG (Thrust Maneuvering Group) moves south to conduct pursuit attacks against withdrawing I MEF forces. Throughout the operation, 713 BCG (Combat Reserve Group) secures lines of communication in the Garrison Zone.

Enemy COA 2 TCOA Statement

Overview

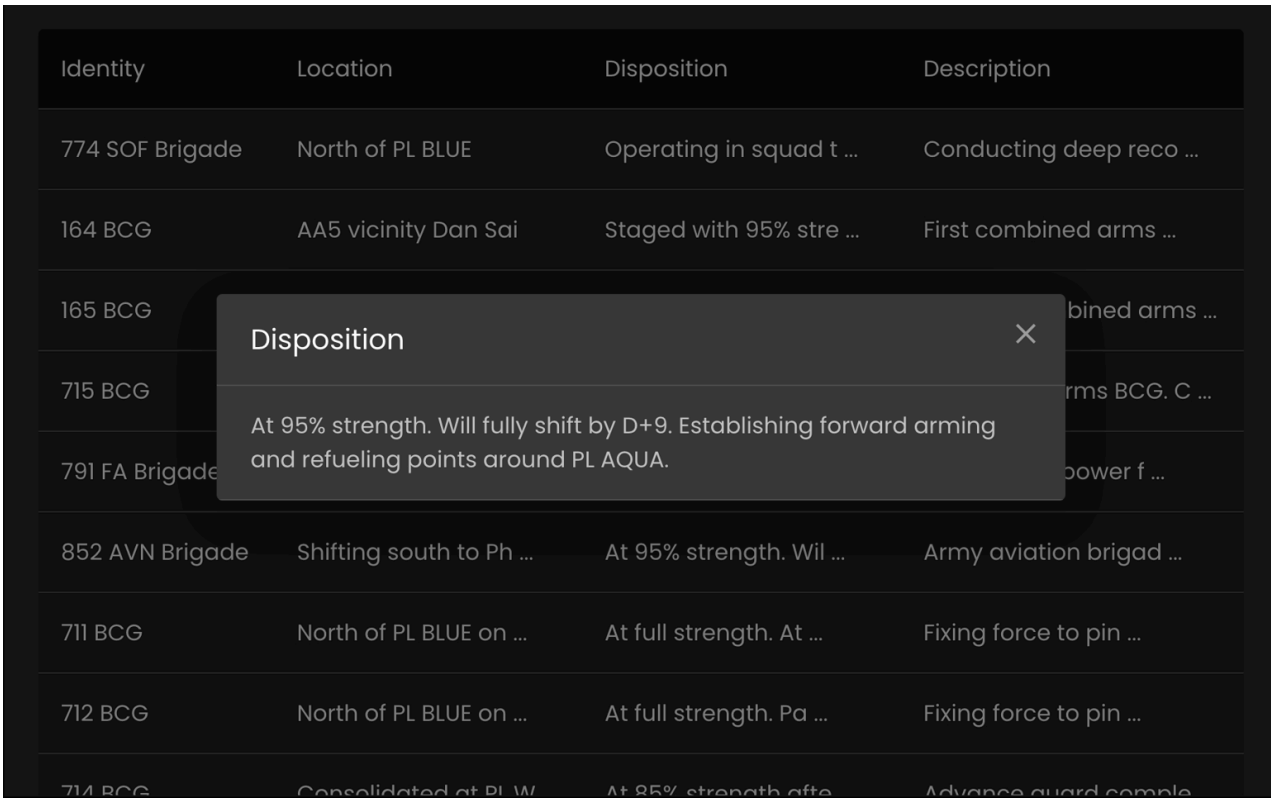
Every threat COA includes a threat COA statement, which is a narrative that describes the Situation Template (SITEMP) as an overlay.

Threat Description Table

How to create a Threat Description Table

Example Prompt

```
Create a Threat Description Table for the 71st ACG
```



71st ACG Threat Description Table

Overview

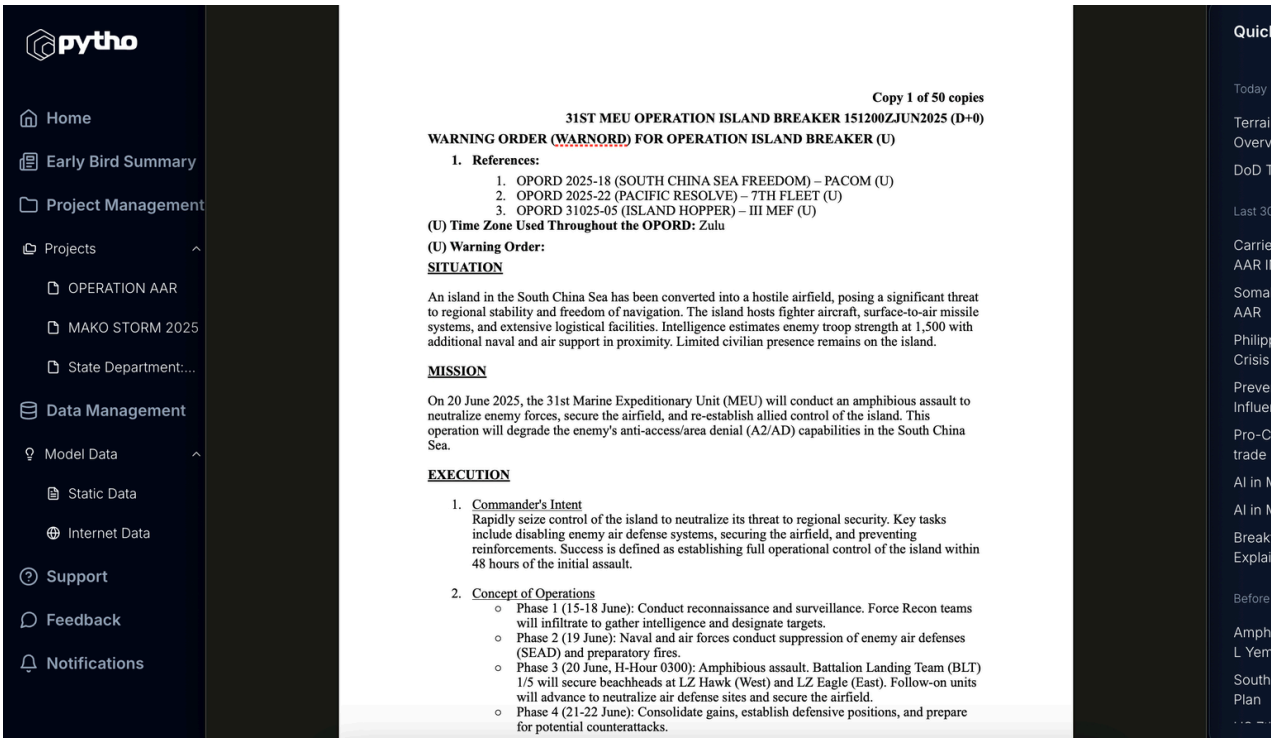
The threat description table supports the threat overlay by classifying the types of threats identified on the overlay and describing the broad capabilities of each threat.

Warning Order

How to Create a Warning Order (WARNORD)

Example Prompt

```
Create a Warning Order for a MEU operation to retake an island that serves as a threat airfield in the South China Sea.
```



WARNORD

Overview

A WARNORD is a preliminary notice of an order or action to follow. Though less detailed than a complete OPORD, a WARNORD aids in parallel planning. After the leaders receive new missions and assess the time available for planning, preparing, and executing the mission, they immediately issue WARNORDs to their subordinates. By issuing the initial WARNORDs as quickly as possible, they enable subordinates to begin their own planning and preparation (parallel planning) while they begin to develop the OPORDs. When they obtain more information, they issue updated WARNORDs, giving subordinates as much as they know.

Leaders can issue WARNORDs to their subordinates right after they receive higher command's initial WARNORDs. In their own initial WARNORDs, they include the same elements given in their higher headquarters' initial WARNORDs. If practical, leaders brief their subordinate leaders face-to-face, on the ground. Otherwise, they use a terrain model, sketch, or map.

Helpful Tips

Reach out to us with any questions!

Reach Out to Pytho!

For any questions, comments, and feedback, please reach out to the Pytho team! We will respond quickly and build accordingly.

Prompting

> Prompting is important! Be as specific as you can with your prompts. If you do not get what you want on your first try, then tell Pytho how you want to adjust the response. You'll get better with practice.

- Spelling doesn't matter too much, so you do not need to spend so much time worrying about that.
- Clarity is important. Tell the War Room exactly what you want.
- Provide context to improve the models' understanding.
- Give an example of an output that is desirable so the models can adapt to that.
- Specify length if it is important to your use case.
- Experiment and iterate. Don't give up if the models do not give you what you want on your first try. Keep asking and explaining.

Developers

Developer resources.

Our API uses web sockets instead of REST for two main reasons:

1. Web sockets enable us to maintain long-lasting connections between clients and servers.
2. With web sockets, the server can start streaming responses as soon as they're generated, rather than waiting for the entire response to be completed.

Here is a sample request in JavaScript:

```
const websocket = new WebSocket(config.webSocketApiGateway.URL);

websocket.onopen = () => {
 websocket.send(
   JSON.stringify({
     action: 'chat',
     userId: user.userId,
     email: user.email,
     session: session,
     productType: productType,
     prompt: prompt,
   })
 )
}
```

And, here is a sample response handler:

```
websocket.onmessage = ({ data }) => {
 data = JSON.parse(data)
  …
})
```
